About the Atlas Monitor

The Atlas Monitor combines in one unit all the necessary measurements for patients under anesthesia, for surgical recovery, or bed side monitoring. See Section 1, page 5 for a complete listing of product models and options.

According to the standards of care for Nurse Anesthetists and Anesthesiologists, all patients receiving conscious sedation are to be continuously monitored throughout the procedure and recovery phase by ECG, SpO_2, and NIBP. CO_2 monitoring is a requirement during gas anesthesia (when patient is ventilated).

The Atlas combines a CRT to display ECG, CO_2, SpO_2, and respiration waveforms. It utilizes LEDs for the other numeric values to maximize visibility and viewing angle. Although not designed to be a transport product, the monitor has an integral handle and it is small and light enough at 13 lbs. to be easily moved.

A battery was added to enable the monitor to be used if there is a power outage or to be unplugged momentarily when moved with the patient from the surgery room to the recovery room. The battery was not designed to make the Atlas into a transport monitor. The Atlas monitor should be plugged into AC as much as possible to give you the maximum battery backup time when there is a power outage. It will maintain unit operation for up to an hour when power is interrupted if the battery is fully charged.

WARNING: Discharging the battery frequently will shorten the battery life and will shorten the battery backup time.

IMPORTANT: For a complete description on the function and use of the Atlas, as well as user safety warnings, cautions, and warranty information, read and understand the Atlas Operator's Manual. See the Table 1-1 below for correct Operator's Manual part #.

Table 1-1. Operator manual part numbers.

Language	Part#
English	6200-42E
French	6200-42F

Help Information

To assure correct operation and performance all service and repairs must be performed by fully trained and properly equipped personnel, using genuine replacement parts and correct procedures. Failure to do so will also invalidate the product warranty.

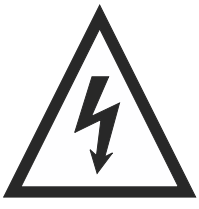
Australia EMC Framework Compliance

Warning, Cautions and Notes

All operating and service personnel should be familiar with the general safety information in this summary. Specific warnings and cautions will also be found throughout the operators manual. Such specific warnings and cautions may not appear here in the summary.

Defbrillator-Proof, Type CF Alllied Part

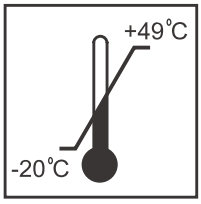


Electrical Shock Hazard

ATTENTION. Consult accompanying document

Handle With Care

Storage Humidity. Refer to technical specifications in operator's for more details.



Storage temperature. Refer to technical specifications in operator's manual for more details.

Lead Acid Battery. For disposal see maintenance section in opertor's manual

Product Model Number Structure

621S0-E1 ECG, Nonin SpO_2, NIBP

621SP-E1 ECG, Nonin SpO2, NIBP, Printer

621N0-E1 ECG,Nellcor SpO2,NIBP

621NP-E1 ECG,Nellcor SpO_2,NIBP, Printer

622S0-E1 ECG, Nonin SpO_2, NIBP, Temp, Respiration, Battery, RS232

622SP-E1 ECG, Nonin SpO_2, NIBP, Temp, Respiration, Battery, RS232, Printer

622N0-E1 ECG, Nellcor SpO_2, NIBP, Temp, Respiration, Battery, RS232

622NP-E1 ECG, Nellcor SpO_2, NIBP, Temp, Respiration, Battery, RS232, Printer

623SP-E1 ECG, Nonin SpO_2, NIBP, $ETCO_2$, Temp, Respiration, Battery, RS232, Printer

623NP-E1 ECG, Nellcor SpO_2, NIBP, $ETCO_2$, Temp, Respiration, Battery, RS232, Printer

Product Structure Meaning:

The first three digits in the product structure sequence designates the model number. The fourth character in the sequence designates the SpO_2. The fifth character in the sequence designates if it has a printer or not. The first suffix designates the country language when shipped. The second suffix designates the power cord shipped with the Atlas.

First Three Characters: Model number, 621, 622, 623

Fourth Character: N=Nellcor SpO_2, S=Nonin SpO_2

Fifth Character: P=Printer, 0=No Printer

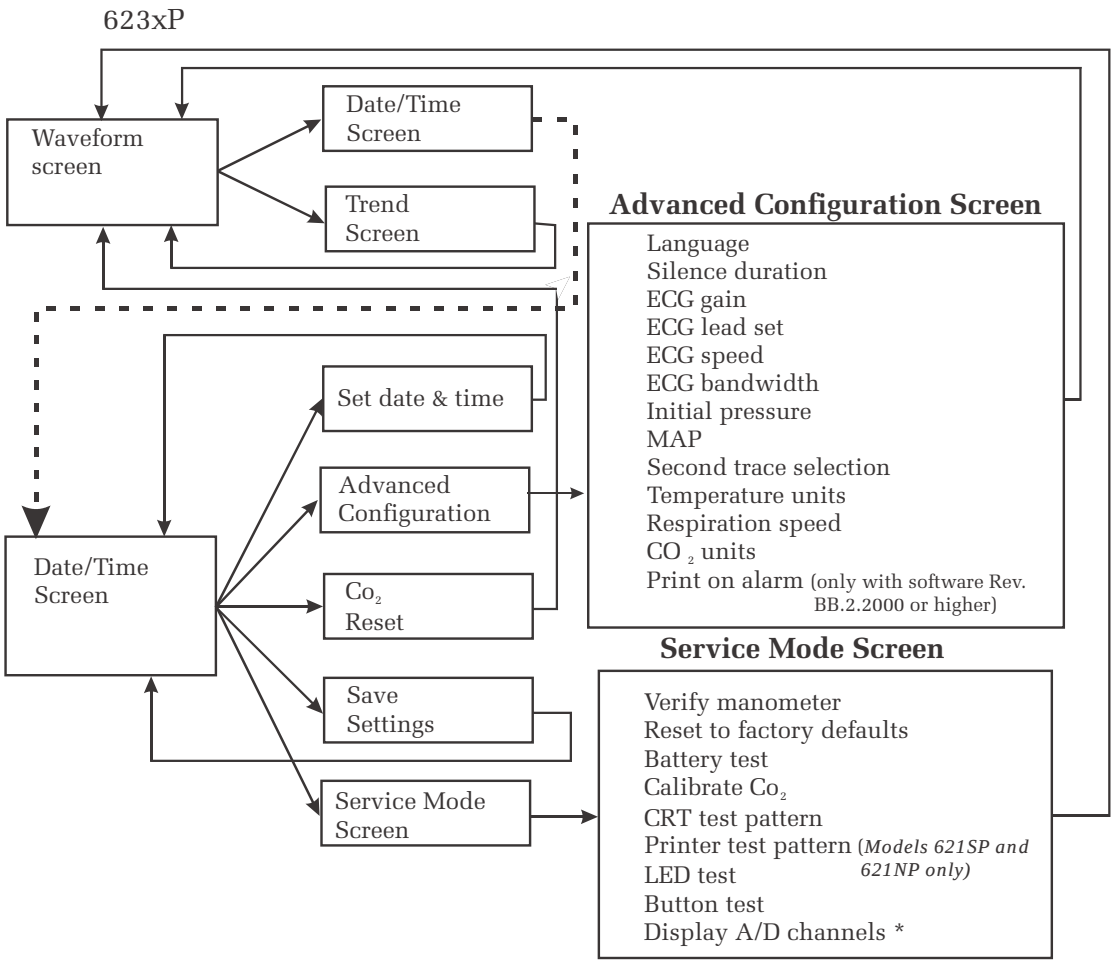
First Suffix: E = English, F= French, G= German, I= Italian, S= Spanish, P= Portuguese C = Chinese,
J= Japanese

Second Suffix:

1 = US, Canada, Japan
2 = European
4 = United Kingdom
6 = Australian

623xP Main Menu Architecture

Figure 1-1. 623xP Main Menu Architecture.



NOTE: *The **Print on alarm** function in **Advanced configuration** mode screen is only available with software version **BB.2.20**00 and higher.*

* ***NOTE:*** *The **Display A/D channels** function in the **Service Mode Screen** only allows you to view system information by pressing the **SET** button. It does not allow you to change system settings.*

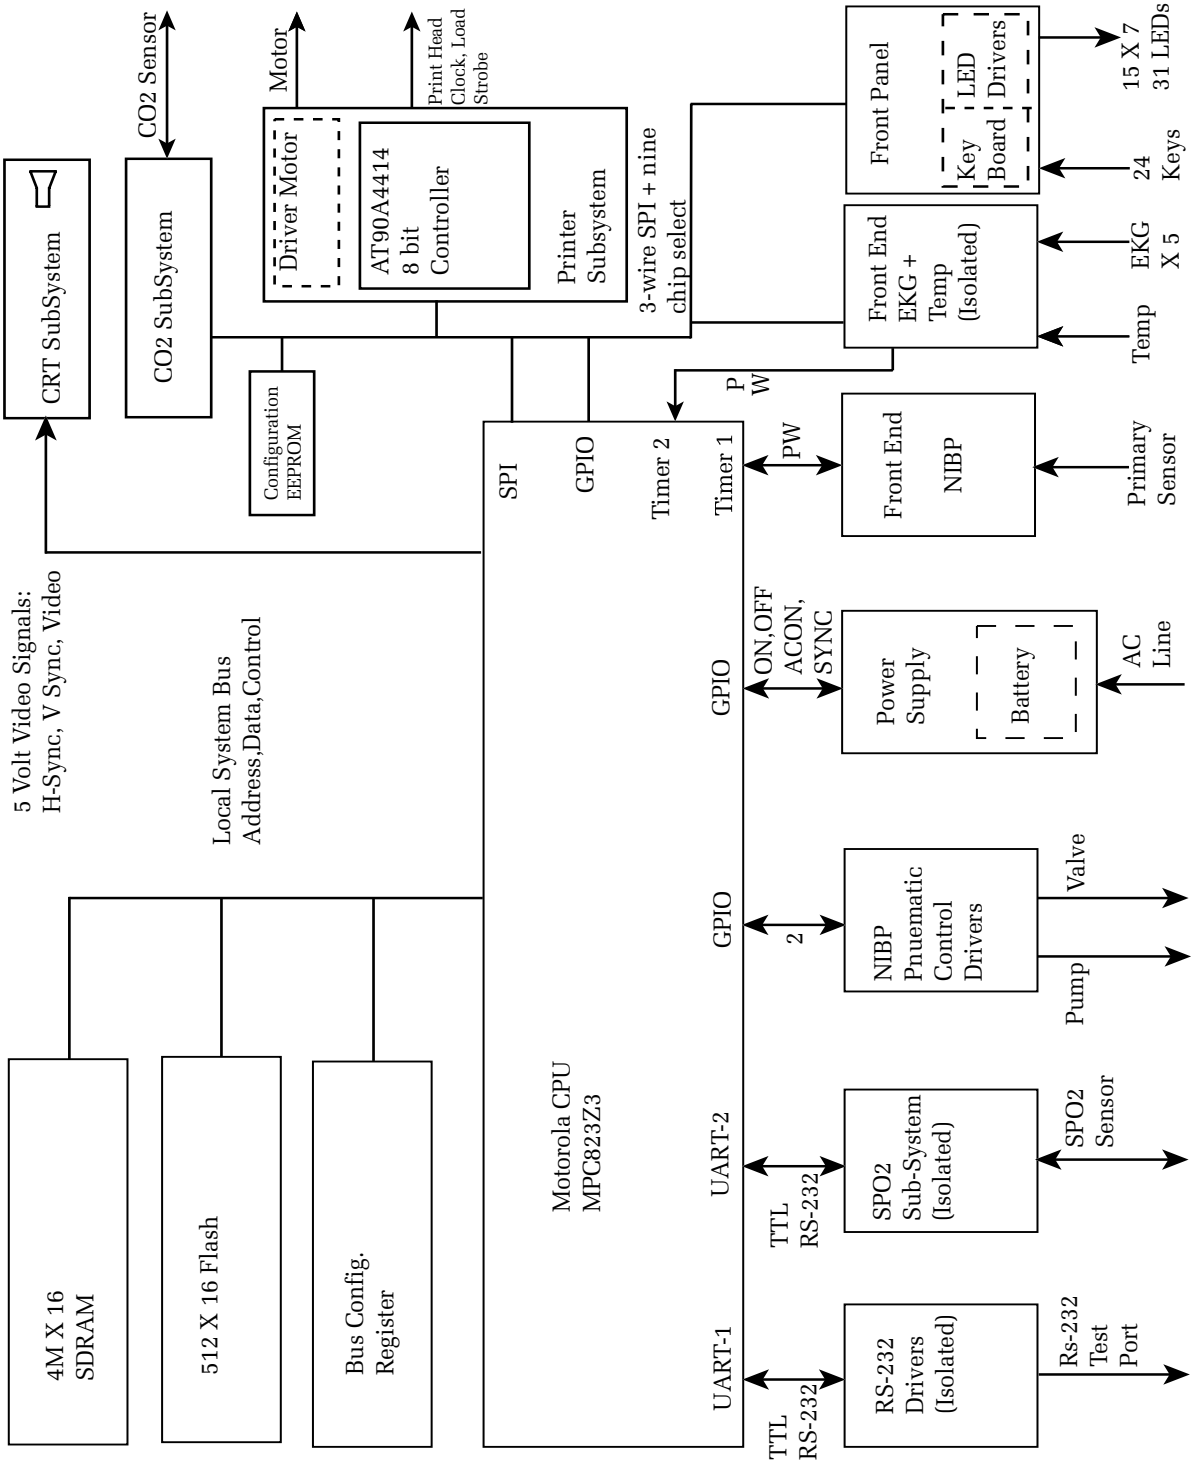
NOTE: *The **Print on alarm** function in **Advanced configuration** mode screen is only available with software version **BB.2.2000** and higher.*

NOTE: *On models 621S0 and 621N0 delete the **Print test pattern** function in the **Service Mode Screen**. Model 622S0 and 622N0 do not come with printers.*

* ***NOTE:*** *The **Display A/D channels** function in the **Service Mode Screen** only allows you to view system information by pressing the **SET** button. It does not allow you to change system settings.*

Atlas System Block Diagram

Figure 1-4. Atlas System Block Diagram



Incoming Inspection

NOTE: *Use the following guidelines when unpacking the monitor from its shipping carton.*

1. Before opening the monitor shipping carton, check for damage.

2. If damage is apparent, stop unpacking the carton and contract the shipping company for further instructions. If the carton is intact, unpack the monitor.

3. With the monitor out of its carton, check to see that all the items listed on the packing slip are in the shipping carton. See table 2-1 below.

Table 2-1. Atlas Packing List.

Qty.	Description	
1	Warranty card	
1	Adult Durable 1pc. Cuff	
1	Large Adult Durable 1pc. Cuff	
1	5ft. Straight Hose	
1	ECG Patient Cable (Three Lead)	
3	ECG Lead Wires	
1	SpO_2 Sensor/ Finger Clip	
1	$ETCO_2$ Water Trap	623 only
1	$ETCO_2$ Scrubber	623 only
1	Nasal Canula	623 only
1	Atlas Monitor	
1	Detachable Power Cord	
1	Printer Paper Roll	
1	Operation Manual	
1	Skin Temperature Probe	622/623 only

4. If an item is missing, first check the carton, then check with your receiving department. If necessary contact Welch Allyn at the address and phone number shown on Section 1.

5. Clean and disinfect by following the instructions printed in the Operator Manual.

NOTE: *Perform all functional tests as listed in Section 3 before and after servicing. Operate the Atlas to verify the customer complaint before making any changes to the unit. Call the customer if the complaint is unclear.*

If the unit has caused or is suspected of having caused an injury of any type: DO NOT DISASSEMBLE OR REPAIR THE UNIT IN ANY WAY. Contact Welch Allyn Customer Service immediately.

Calibration and Maintenance Schedule

The Atlas Monitor must be serviced by authorized Welch Allyn personnel or agents at 6 month intervals. Maintenance requirements are specified for 6 month and 12 month service intervals. The monthly CO_2 Reset operation can be performed by the user.

Service Interval	Maintenance Requirements
Every 6 months:	CO_2 Calibration
Every 12 months:	BP calibration, CO_2 reset, battery voltage calibration, printer adjustment,and temperature calibration. Complete functional test

Table 2-2. Tools Required for Service.

Description	Part#	Company
100cc Test Volume	T-112189	Welch Allyn
500cc Test Volume	T-112854	Welch Allyn
T-10 TORX screwdriver	XTD-10	Xcelite brand

1000 Ohm precision resistor 1%		
1200 Ohm precision resistor 1%		
1350 Ohm precision resistor 1%		
1540 Ohm precision resistor 1%		
1870 Ohm precision resistor 1%		

Setting Date and Time

NOTE: *Check date and time before doing any calibration. Set date and time if incorrect. Set time and date as follows;*

1. Turn Atlas on.

2. Press **CLOCK** button next to power on button to check date and time. Use the far right **SELECT** button to scroll. Highlight the date or time that needs changed.

3. Press the **SET** button to adjust date and time.

4. Press **CLOCK** button to exit.

Pangea Communication Protocol

The Pangea Communication Protocol allows interaction of the Atlas with the computer through the serial interface port. A prompt is emitted at the computer screen when the instrument powers up and is ready to accept commands. The prompt is **Pangea>**. A prompt is emitted after the completion of each pangea command. Pangea commands are case sensitive. They are in English only.

B**P Calibration**

Required material.

1. 500cc vessel
2. Squeeze bulb with one-way valve
3. PC with HyperTerminal
4. Calibrated digital manometer
5. Tubing and T fittings
6. Serial cable

NOTE: *To start HyperTerminal you must have Windows*7 *95 or higher installed on your computer.*

1. From the Windows main screen follow the following sequence:
   Start ⇨Programs ⇨ Accessories ⇨ Communication ⇨ HyperTerminal

2. HyperTerminal setting are:
   9600 baud rate, 8 bit word, 1 stop bit
   no parity, no flow control
   ANSI character set

3. When you open HyperTerminal you will see a screen similar to the example in Figure 2-1. You will be prompted for a connection description. Choose any name. After you type in a name click **OK**.

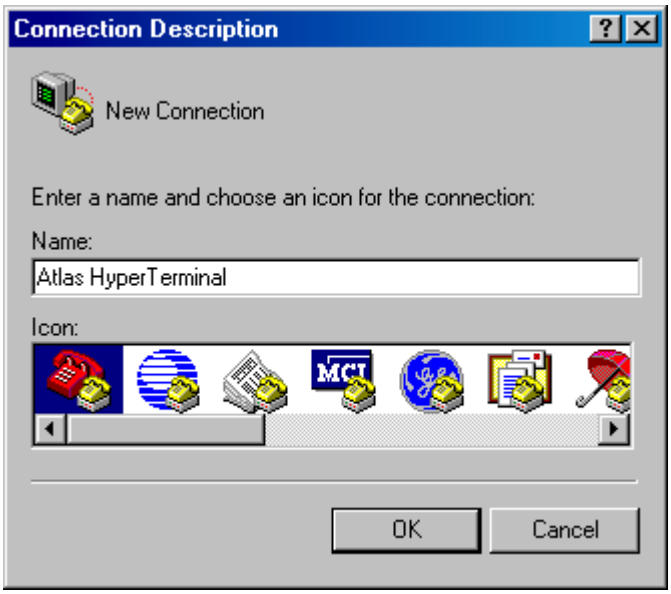

Figure 2-1. Example of a new HyperTerminal connection.

4. The next window you will see will be the window as shown in Figure 2-2. Click on **Connect using** then click on **COM1.**

Figure 2-2. Choosing COM1 in HyperTerminal.

5. Set the port settings as shown in the example in Figure 2-3. Now click **OK**.

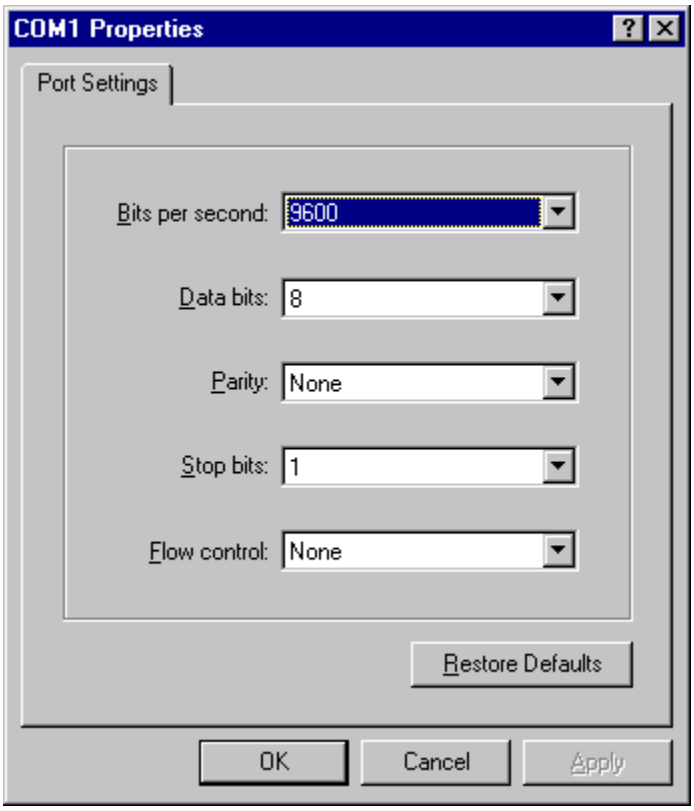

Figure 2-3. HyperTerminal Port Settings.

6. Connect the pressure meter, bulb, and 500cc vessel to BP port with “T” connectors as shown in photograph Figure 2-4.

7. Connect the Atlas to PC with serial cable.

8. Turn the Atlas on. Start HyperTerminal on PC. Press the <Enter> key and you should see a **Pangea>** prompt.

NOTE: *Take no more than 3 minutes for the 50mmHg calibration nor more than 3 minutes for the 250mmHg calibration as the Atlas will automatically, as a safety feature, open the blood pressure valve. If this happens you will have to turn the Atlas off then back on again and restart the calibration again.*

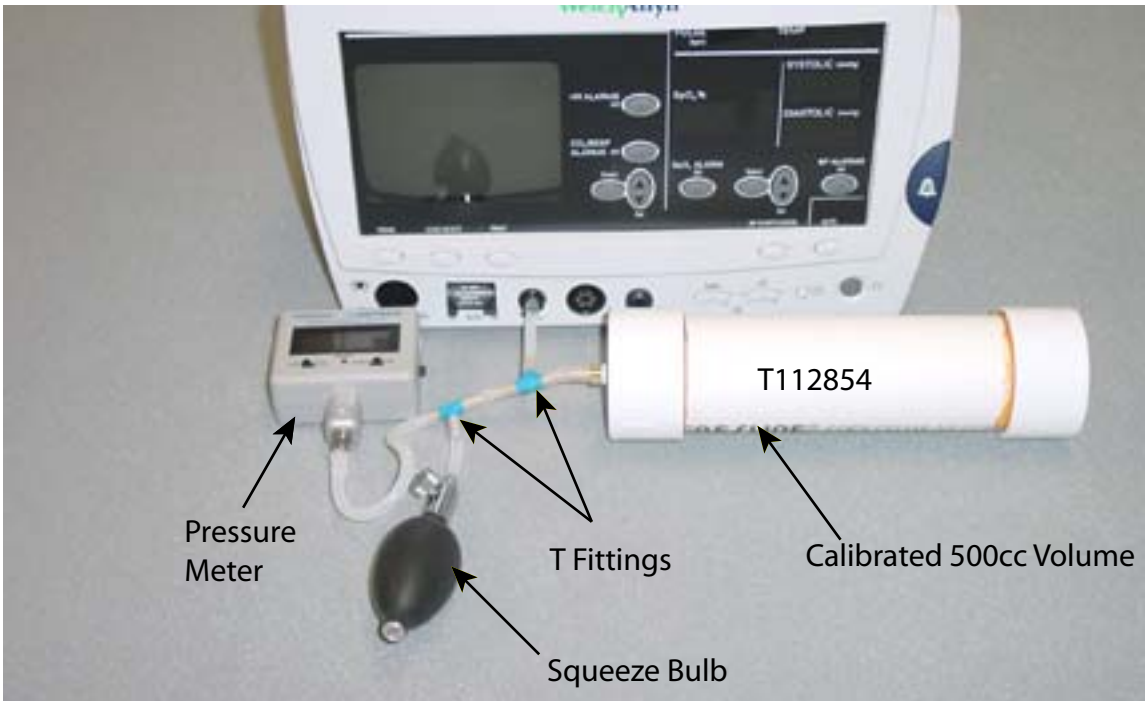

Figure 2-4. Photo of Atlas BP calibration setup.

50mmHg Calibration

1. Enter the following commands at the Pangea prompt.
   Pangea> **bp valve close** <ENTER>
   Pangea> **bp safety off** <ENTER>
   Pangea> **bp cal 5000** *Do not press <ENTER> yet!*

2. Raise the pressure with bulb to as close to 50.00mmHg as possible. Now press <ENTER>.

3. Release the pressure.

250mmHg Calibration

1. Enter the following command
   Pangea> **bp cal 25000** *Do not press <ENTER> yet!*

2. Raise the pressure with bulb as close to 250.00 mmHg as possible. Now press < **ENTER** >

3. Enter the following command to save the calibration in the Atlas.
   Pangea> **nvram write** <ENTER>

4. Release the pressure.

CO_2 Reset (623xx Models Only)

Required material. 1. Watertrap
2. Scrubber

NOTE: *The Scrubber looks similar to a watertrap, but it is filled with white granules. The scrubber is included with the 623XX models only.*

NOTE: *Make sure date and time are correct before performing the CO_2 reset.*

1. Turn Atlas on. Make sure the watertrap and scrubber are ***NOT*** attached to the Atlas.

2. Press the **DATE/TIME** button on the lower right of the monitor. The Set Date and Time and Other Options menu will be displayed.

3. Press the **CO_2/RESP ALARMS Off** button. The CO_2 Reset screen will appear.

4. You will see the following messages on the CRT.
   "**CO_2 Reset**"
   "Install CO_2 scrubber"
   "Press Trend to abort"

5. Install the watertrap to the Atlas. Install the scrubber to the watertrap.

6. You will see the following instructions on the screen.
   "**Warming up**" will be flashing on CRT.
   "**May take up to five minutes**" on CRT.
   "**Press Trend to abort**" on CRT.

7. After about 5 minutes you will see on the CRT.
   "**CO_2 Reset**"
   "**Reset complete**"
   "**Remove CO_2 scrubber**"
   "**Press the trend button to exit**"

8. Remove the CO_2 watertrap and scrubber.

9. Press **TREND** button to return to idle screen.

Replace watertrap after every six hours of use. Treat watertrap and used CO_2 sample lines as bio hazard material!

ET CO_2 Calibration

Required material:

1. Tank of approximately 10% CO_2, balance N_2 (certified) Blood Gas Mixture.
2. Tubing and T connectors.
3. Watertrap and scrubber.

1. Make sure the watertrap and scrubber are not attached to the Atlas. Turn the Atlas on.

2. Place the instrument into the Service Mode by pressing the **DATE/TIME** button. Make sure date and time are correct. Press the **LEAD SELECT** button.

3. Press **SELECT** button and scroll down to Calibrate CO_2.
   The message "**Install CO_2 Scrubber**" will appear on the right side of screen.

4. Attach the scrubber to the water trap.

5. Insert the scrubber/water trap assembly into water trap socket. The message "**Enter span gas value using Set button 10%**" will appear.

6. Press the **SET** button to change the value of span gas being used. The factory default value is 10%. Calibrate with a 8% to 12% certified CO_2 concentration known to be ±0.01%).

7. The message press "**BP Start/Cancel**" will appear at the bottom right of CRT. Press the **BP/Start/Cancel** button.

8. If you receive a "**Calibration Failed**" message at this point, check the date. If date is 2022 or above it will fail CO_2 calibration.

9. Next you will see a message "**Warming up**". After the Atlas warms up you will see a message "**Attach CO_2 gas**". Remove the scrubber from the CO_2 water trap. Do not remove water trap.

10. Attach the certified source of CO_2 gas to the CO_2 side-stream sampling tube as per Figure 2-5 below.

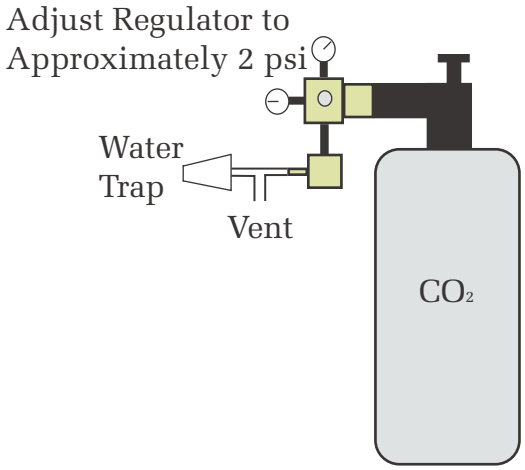

Figure 2-5. Example of CO_2 calibration setup.

CAUTION: IMPROPER USE,STORAGE OR HANDLING OF COMPRESSED GAS VESSELS CAN CAUSE DEATH OR INJURY. FOLLOW GAS MANUFACTURES SAFETY PROCEDURES!

11. Adjust the CO_2 regulator just enough to allow a small amount of gas to flow out of the vent (approximately 2 psi).

12. Press the **BP START/CANCEL** button. The message: "Sampling" will appear on CRT. "**CO_2 calibration successful**" or "**CO_2 calibration failed**" will appear on the CRT display.

13. Press the **TREND** button to exit.

No-Load Battery Voltage Calibration

NOTE: *No-Load Battery Voltage Calibration procedure is for models 622 and 623 only. If you disconnect the battery you must reset time and date after you reconnect the battery.*

Specifications: No load battery charge 6.85 VDC

Required materials: DVM

1. Remove the battery and disconnect the battery leads from the Atlas. Use the DVM to measure across the connectors, red+ and black-.

2. Adjust the voltage to 6.85 VDC by turning potentiometer R338, located behind the right battery jack. Turning clockwise will increase the no-load voltage and counter clockwise will decrease the no-load voltage.

Battery Voltage Calibration

Required materials.

1. DC power supply rated: 7 VDC at 5A
2. DMM / DVM with 10mV resolution on a 10 DC volt scale.
3. PC with HyperTerminal
4. Serial interface cable

1. Connect the serial cable to the PC and Atlas.

2. Hyper Terminal Settings are:
   9600 Baud, 8 bit word, 1 stop bit
   no parity, no flow control
   ANSI character set
   Find HyperTerminal in Windows 95 or higher
   Start ⇨Programs⇨Accessories ⇨ Communication⇨ HyperTerminal

NOTE: *Make sure the Atlas* ***IS NOT*** *plugged into AC for this calibration procedure.*

3. Remove and disconnect the battery from Atlas.

4. Set the power supply to 6.8VDC ± 200mV and connect the power supply to the battery connector on the Atlas.

5. Turn Atlas on..

6. Reduce the power supply to 6.0VDC and measure the voltage at the battery connector (at the Atlas) to the nearest 10mV.

NOTE: *Do not measure at the power supply, since cable resistance will introduce error.*

7. At the HyperTerminal prompt type:
   Pangea> **power cal XXXX** <ENTER>

NOTE: *XXXX represents the measured voltage in millivolts no decimal point. For example, if you measured 6.010VDC at the battery connector, use the command "****power cal 6010*** *<ENTER>".*

8. The Atlas will respond: raw = ZZZZ mV true = 6010 mV OK

NOTE: *ZZZZ is the raw uncalibrated reading that the instrument made.*

9. Reduce the power supply to 5.6 VDC. You should soon hear the "**low battery**" alarm.

10. Measure the voltage at the battery connector to the nearest 10mV.

11. At the HyperTerminal prompt type:
    Pangea> **power cal XXXX** <ENTER>

NOTE: *XXXX represents the measured voltage in millivolts with no decimal point. For example if you measured 5.590 volts at the battery connector, then you would enter the command "**power cal 5590**" <ENTER>.*

12. The Atlas will respond:
    raw = ZZZZmV true = 5590 OK

NOTE: *ZZZZ is the raw uncalibrated reading that the instrument made.*

13. Finish the calibration by typing:
    Pangea> **hw reset** <ENTER>

NOTE: *This will re-boot the Atlas.*

14. Turn the Atlas off and reinstall the battery.

15. Reset time and date.

Printer Print Adjustment

1. Install new paper.

2. Turn Atlas on.

3. Attach an ECG simulator to Atlas and set simulator for a heart rate of 60 bpm, normal sinus rhythm.

4. Press **PRINT** button. Evaluate the darkness of waveform and text printout.

5. If either need to be changed press **DATE/TIME** button then press **LEAD SELECT** button to access Advanced Configuration menu.

6. Press **SELECT** button and scroll down to Printer Test Pattern. Then Press **HR ALARMS OFF** button

7. Two lines will be displayed:
    1. Waveform+128
    2. Text+ 78

NOTE: *These two numbers are the factory defaults and are a good starting point if the system is printing poorly or not at all.*

8. The left **SET** button controls the waveform darkness and the right **SET** button controls the text darkness.

NOTE: *Pressing the **SET** button up will increase the number and darken the waveform while pressing the **SET** button down will decrease the number and will lighten the waveform.*

9. Make changes to the printout as needed.

10. Press **Trend** button to return to waveform screen.

Temperature Calibration

Required Material:

1. PC with Windows7 95 or higher
2. Atlas serial cable
3. 1k Ohm, 1/2 watt precision resistor
4. 1/4″ mono phono jack
5. Soldering iron and solder
6. Ohm Meter

1. Solder the 1 K Ohm resistor to 1/4” mono phono jack.

2. Measure the resistance at the tip of the phono jack. Record that resistance reading, to two decimal points.

3. Plug the phono jack into the Atlas.

NOTE: *The Atlas will show a temperature reading in the temperature display.*

4. Start HyperTerminal on PC.

5. Hyper Terminal Settings are:
   9600 Baud, 8 bit word, 1 stop bit
   no parity, no flow control
   ANSI character set
   Find HyperTerminal in Windows7 95 or higher
   Start ⇨Programs ⇨ Accessories ⇨ Communication ⇨ HyperTerminal

6. At the Pangea prompt Type: PANGEA> **temp cal XXXXXX** <ENTER>

NOTE: *XXXXXX is the resistance reading you measured and recorded in milliohms at the tip of the mono phono jack.*

Example: If you measure 1000.40 ohms at the tip of the phono jack then you would type **temp cal 100040** <Enter>.

7. Wait four seconds then type: PANGEA> **temp state** <ENTER>. You will see a value returned at the Pangea prompt.

8. Verify that the resistance given by the above command returns a value ± 0.5 ohms.

9. Verify temperature accuracy as outlined in Chapter 3, Table 3-2.

Calibration Date Set

NOTE: *After calibrating the Atlas you must reset the calibration date. The calibration date is the date you performed the calibration. The calibration date appears in the Service Mode menu. See Figure 2-6 for an explanation of the Service screen.*

1. At the Pangea prompt type.

   Pangea> **nvram set cal_date XXXX** <ENTER>

NOTE: *XXXX is the number of days from January 1, 1998 until the present date. See APPENDIX E for that number or calculate manually.*

Explanation of an Atlas Service Screen

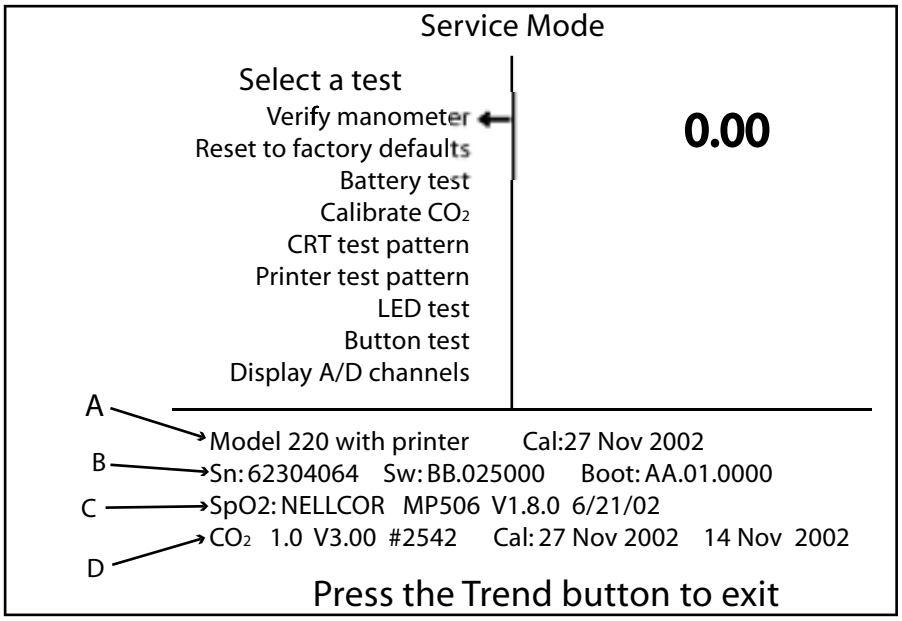

Figure 2-6. Example and Explanation of an Atlas Service Screen

Line A Indicates that the Atlas is a model 220 and that the Atlas has a printer. If the Atlas did not have a printer then the text "with printer" would be absent. The date field following indicates the date the Atlas was last calibrated.

Line B starts with a numeric sequence. The first three digits are the model number of the Atlas. The next five numbers are the Atlas serial number. The next sequence,alphanumeric, indicates what software version is currently loaded into the Atlas. The third sequence, alphanumeric, indicates what version boot software is currently loaded into the Atlas.

Line C starts with the SpO_2 OEM board used in the Atlas. There are two SpO_2 OEM boards used in the Atlas. One is Nellcor and the other is Nonin. The next sequence indicates the model of the SpO_2 board. The next sequence, that starts with a letter "V", is the version software used with the current SpO_2 board. The date following the SpO_2 software is the date the OEM loaded the software into the SpO_2 board. SpO_2 OEM software can not be upgraded. If the most current software is needed, you will need to replace the SpO_2 board.

Line D is the CO_2 information if your Atlas has CO_2 installed. *Only models 623 have CO_2 installed*. If your Atlas does not have CO_2 installed then line **D** will be absent. If your Atlas has CO_2 installed then line **D** will start with CO_2 followed by a numeric number. That numeric value is the software loaded into the CO_2 board. The next alphanumeric sequence, starting with a "V", is the version of that software. The next numeric sequence starting with a "#" is the serial number of the CO_2 board. The next sequence, a date, is the date the CO_2 was last calibrated. The last sequence, a date, is the date the CO_2 was reset. CO_2 OEM software can not be upgraded. If the current software is needed, you will have to replace the CO_2 board.

Table 2-3. Software Revision Table.

Model	Operating System	Boot loader	Nellcor	Nonin	Pryon
621S0	AA.01.4000, 9/8/99	AA.01.0000, 6/20/99		V7	
621S0	BB.02.0000, 4/4/01	AA.01.0000, 6/20/99		V7	
621S0	BB.02.2000, 6/4/02	AA.01.0000, 6/20/99		V7	
621S0	BB.02.5000, 10/14/02	AA.01.0000, 6/20/99		V7	
621N0	BB.02.5000, 10/14/02	AA.01.0000, 6/20/99	V1.8.1.0, 10/14/02		
621SP	AA.01.4000, 9/8/99	AA.01.0000, 6/20/99		V7	
621SP	BB.02.0000, 4/4/01	AA.01.0000, 6/20/99		V7	
621SP	BB.02.2000, 6/4/02	AA.01.0000, 6/20/99		V7	
621SP	BB.02.5000, 10/14/02	AA.01.0000, 6/20/99		V7	
621NP	BB.02.5000, 10/14/02	AA.01.0000, 6/20/02	V1.8.1.0, 10/14/02		
622S0	AA.01.4000, 9/8/99	AA.01.0000, 6/20/99		V7	
622S0	BB.02.0000, 4/4/01	AA.01.0000, 6/20/99		V7	
622S0	BB.02.2000, 6/4/02	AA.01.0000, 6/20/99		V7	
622S0	BB.02.2000, 6/4/02	AA.01.0000, 6/20/99		V7	
622S0	BB.02.5000, 10/14/02	AA.01.0000, 6/20/99		V7	
622SP	AA.01.4000, 9/8/99	AA.01.0000, 6/20/99		V7	
622SP	BB.02.0000, 4/4/01	AA.01.0000, 6/20/99		V7	
622SP	BB.02.2000, 6/4/02	AA.01.0000, 6/20/99		V7	
622SP	BB.02.5000, 6/14/02	AA.01.0000, 6/20/99		V7	
622N0	AA.01.4000, 9/8/99	AA.01.0000, 6/20/99	V 1.2.0.0 12/17/97		
622N0	BB.02.0000, 4/4/01	AA.01.0000, 6/20/99	V 1.2.0.0 12/17/97		
622No	BB.02.2000, 6/4/02	AA.01.0000, 6/20/99	V 1.2.0.0 12/17/97		
622N0	BB.02.5000, 10/14/02	AA.01.0000, 6/20/99	V 1.8.1.0 10/14/02		
622NP	AA.01.4000, 9/8/99	AA.01.0000, 6/20/99	V 1.2.0.0 12/17/97		
622NP	BB.02.0000, 4/4/01	AA.01.0000, 6/20/99	V 1.2.0.0 12/17/97		
622NP	BB.02.2000, 6/4/02	AA.01.0000, 6/20/99	V 1.2.0.0 10/14/02		
622NP	BB.02.5000, 10/14/02	AA.01.0000, 6/20/99	V 1.8.1.0 10/14/02		
623SP	AA.01.4000, 9/8/99	AA.01.0000, 6/20/99		V7	0.E V1.00
623SP	BB.02.0000, 4/4/01	AA.01.0000, 6/20/99		V7	0.E V1.00
623SP	BB.02.2000, 6/4/02	AA.01.0000, 6/20/99		V7	
622SP	BB.02.5000, 10/14/02	AA.01.0000, 6/20/99		V7	
623NP	AA.01.4000, 9/8/99	AA.01.0000, 6/20/99	V 1.2.0.0 12/17/97		0.E V1.00
623NP	BB.02.0000, 4/4/01	AA.01.0000, 6/20/99	V 1.2.0.0 12/17/97		0.E V1.00
623NP	BB.02.2000, 6/4/02	AA.01.0000, 6/20/99	V 1.2.0.0 12/17/97		
623NP	BB.02.5000, 10/14/02	AA.01.0000, 6/20/99	V 1.8.1.0 10/14/02		

Software Upgrade Procedure

NOTE: *The following procedures are required to upgrade the software on a fully functioning Atlas or to reload software after replacing the CPU board. The download utility "**atlas_dl.exe**" loads the following files automatically.*

1. *atlas.out.gz*
2. *nvram_common.txt*
3. *nvram_(model#).txt*
4. *nvram_(language).txt*

"Atlas_dl.exe" will also query the Atlas to determine what model number the Atlas is and what language to download.

Equipment or supplies required:

1. PC with Windows7 95 or higher
2. Atlas serial cable
3. File: atlas_dl.exe (Included in the Atlas Repair Software listed in Table2-2.)

NOTE: *Make sure you have HyperTerminal turned off or the following utility download will not work!*

1. Run the program **atlas_dl.exe** from the CD or copy the file to your hard drive and run the program from there.

2. Connect the serial cable between the Atlas and the PC s'"COM1 port".

3. Turn your computer on and locate the "atlas_dl.exe" file.

4. Double left click on the "atlas_dl.exe" file.

5. When the file starts to download, the CRT will go blank on the Atlas.

NOTE: *Do not use the computer while the program is downloading.*

6. After down loading is complete, check all alarm settings and all user advanced configuration settings since these are ***RESET*** by this utility software download procedure.

NOTE: ***Stop here*** *if you are just upgrading software on a fully functional Atlas monitor or if you have replaced the CPU board.*

NOTE: *If you have replaced the **MAIN BOARD** then you **MUST** continue with the next procedure (**DOWNLOADING NVRAM FILES**).*

NOTE: *Perform the following NVRAM downloading procedure if you have replaced the MAIN BOARD. The NVRAM resides on Main Board.*

Down Loading NVRAM Files

Required Materials.

1. Computer with Windows7 95 or higher.
2. The latest Atlas repair software. Call your local Welch Allyn representative.

1. Once you have procured the latest Atlas Repair Software, you will be able to run the programs straight from the CD or copy the files to your hard drive.

NOTE: *Through HyperTerminal you will need to load the following files:*

1. nvram_cal_init.txt
2. nvram_common.txt
3. model# of Atlas
3.1. You will load "nvram200.txt" if your Atlas is a model 621xx.
3.2. You will load "nvram210.txt" if your Atlas is a model 622xx.
3.3 You will load "nvram220.txt" if your Atlas is a model 623xx.
4. "language.txt" Any combination of or all of the following files
4.1 "nvram_english.txt" for the English language
4.2 "nvram_french.txt" for the French language
4.3 "nvram_german.txt" for the German language
4.4 "nvram_spanish.txt" for the Spanish language
4.5 "nvram_potuguese.txt" for the Portuguese language
4.6 "nvram_italian.txt" for the Italian language
4.7 "nvram_chinese.txt" for the Chinese language
4.8 "nvram_japanese.txt" for the Japanese language
5. printer.txt (if fitted with a printer), or no_printer.txt. (if not fitted with a printer)

NOTE: *After loading the preceding files you, must then type the following commands at the Pangea prompt.*

1. "nvram set serial xxxxx" where xxxxx is the serial number of the Atlas monitor.
2. "nvram write" writes the information to memory.
3. "hw reset" performs a hardware reset.

2. Connect the serial cable between the Atlas and the PC COM1 port.

3. Open HyperTerminal program on PC.
   Hyper Terminal Settings are:
   9600 Baud, 8 bit word, 1 stop bit
   no parity, no flow control
   ANSI character set
   Find HyperTerminal in Windows7 95 or higher
   Start ⇨Programs ⇨ Accessories ⇨ Communication ⇨ HyperTerminal

4. Turn Atlas on. You should see the Pangea prompt. See example in Figure 2-7.

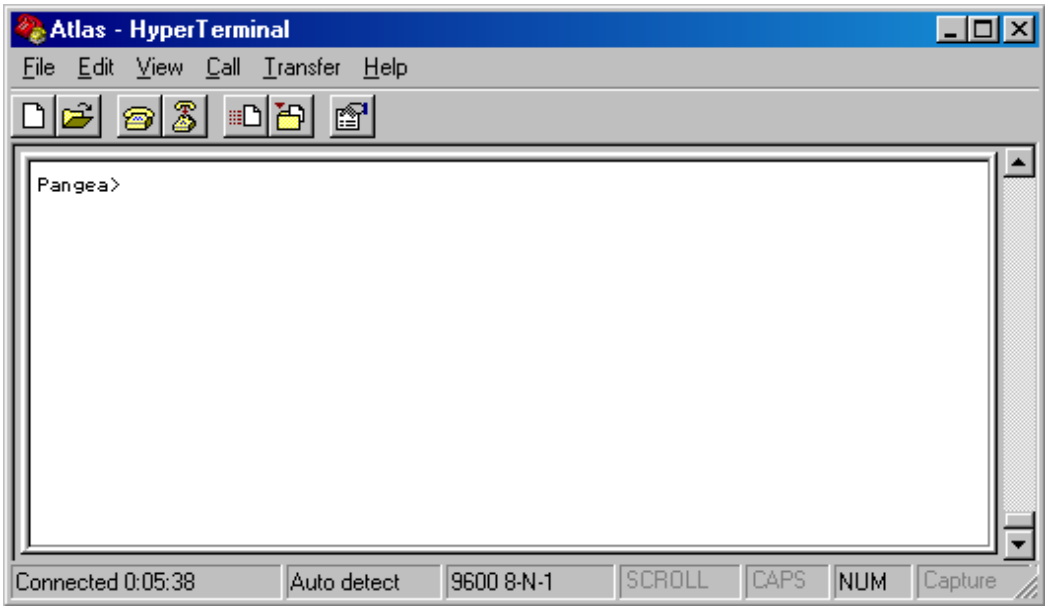

Figure 2-7. Pangea prompt in HyperTerminal.

5. Scroll over to "**Transfer**" and then scroll down and choose "**Send Text File**". See example in Figure 2-8.

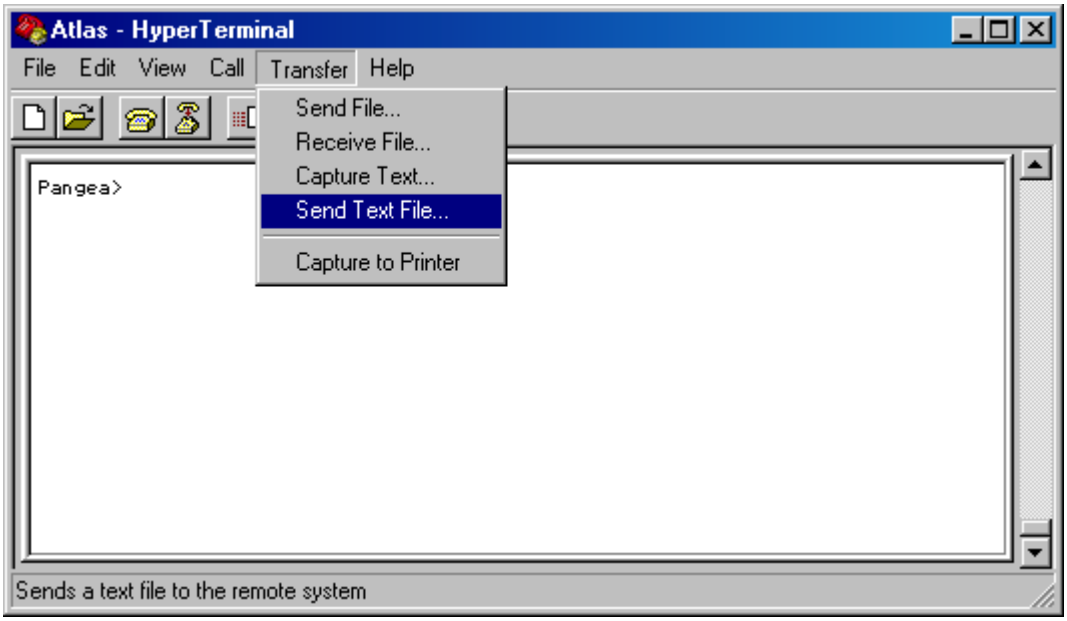

Figure 2-8. Choosing "Send Text File" in HyperTerminal.

6. Another window will then appear and prompt you for the location of the files. Double left click on that folder to open that directory. You can also run these programs from the CD. See example in Figure 2-9.

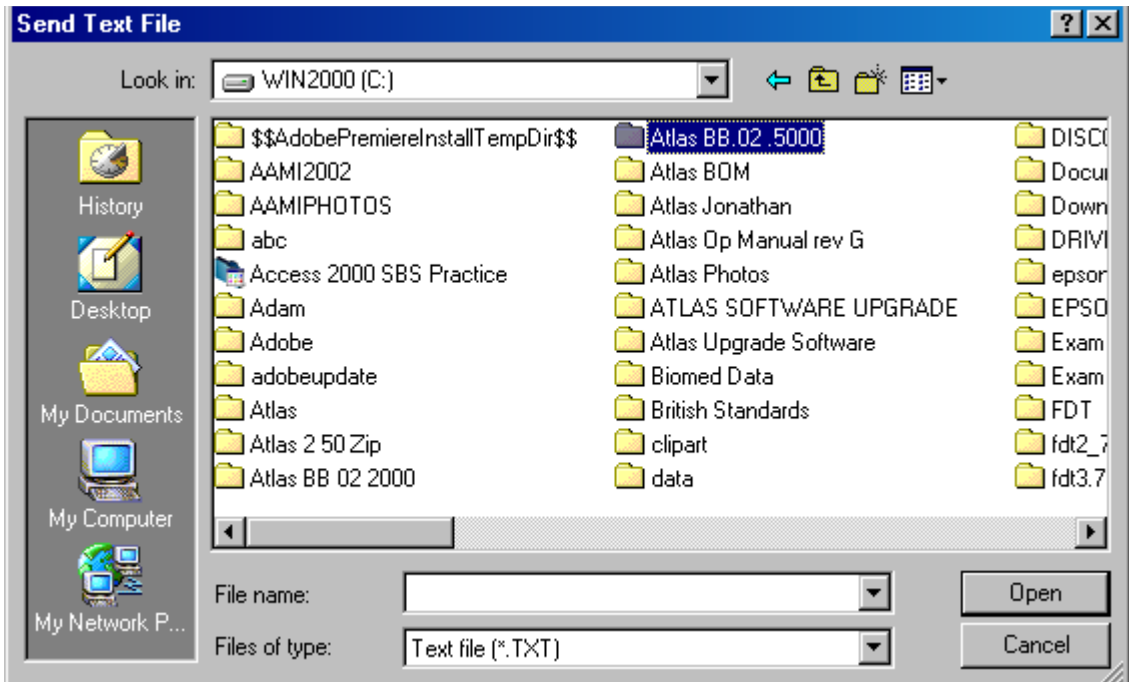

Figure 2-9. Choosing directory where NVRAM files are stored.

7. Once the folder is open, open the file "**nvram_cal_init.txt"** file by double left clicking on that file or by high lighting the file and then click on the **Open** button. See example in Figure 2-10.

*Remember that after you have download the files in this section and you **must** complete this entire "**Downloading NVRAM files**" section, that you **must** perform a complete calibration on the Atlas monitor.*

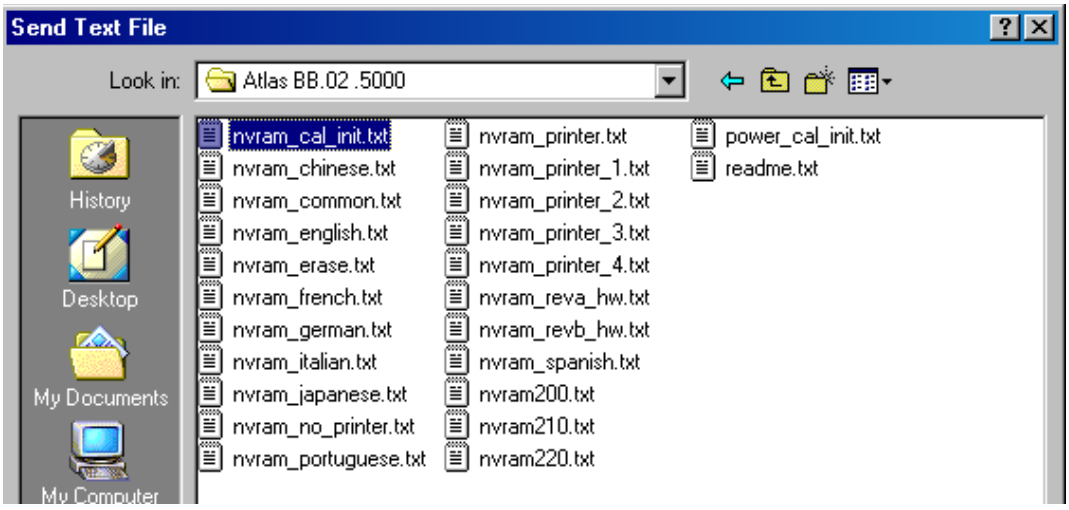

Figure 2-10. Choosing the nvram_cal_init.txt file.

NOTE: *After the* ***nvram_cal_init.txt*** *has executed you should see a Pangea screen similar to window as shown in Figure 2-11.*

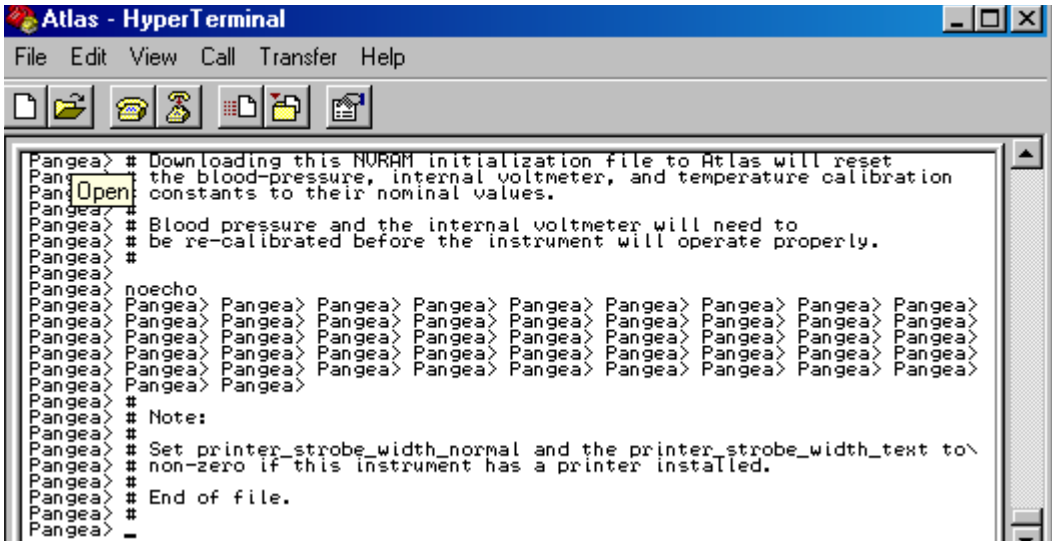

Figure 2-11. Pangea screen after opening the **nvram_cal_init.txt** file.

8. From your pangea window choose **Transfer** then choose **Send Text File**.

9. Open the directory where the file **nvram_common.txt** is located or open from the CD.

10. Double left click on **nvram_comm.txt** file or highlight the file and then choose **Open**.

NOTE: *After opening the* ***nvram_common.txt*** *file you should see a screen similar to the window shown in Figure 2-12.*

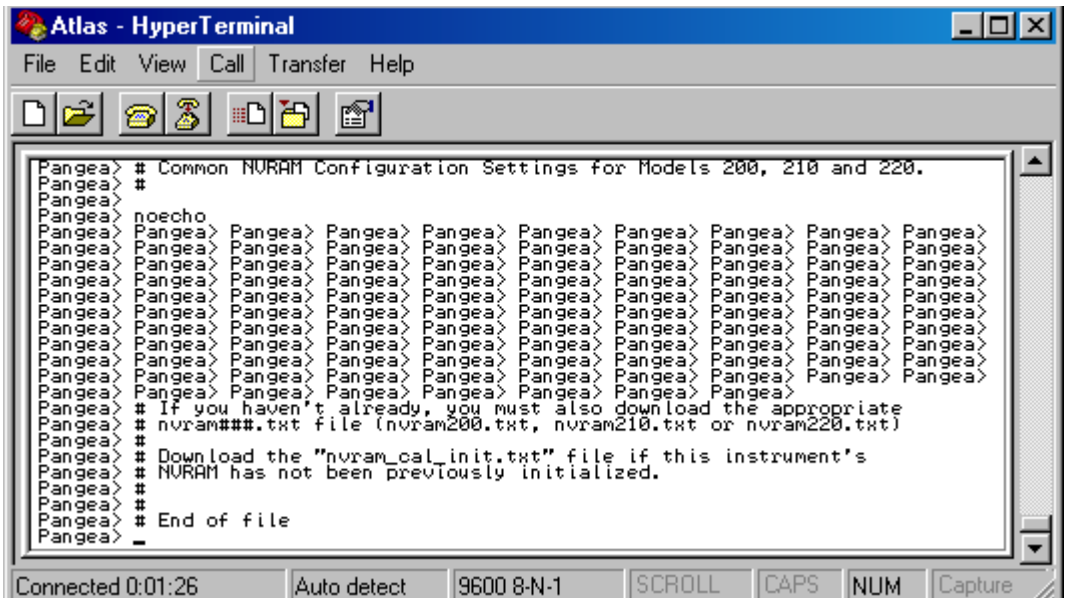

Figure 2-12. Pangea screen after opening the nvram_common.txt file.

NOTE: *Next you will download the model# of the Atlas by choosing* ***only*** *one of the three following files.*

1. *If you have an Atlas model 621 then you will* ***only*** *download the file* ***nvram200.txt.***
2. *If you have an Atlas model 622 then you will* ***only*** *download the file* ***nvram210.txt.***
3. *If you have an Atlas model 623 then you will* ***only*** *download the file* ***nvram220.txt.***

11. Open the directory where the model number files are located or open from CD.

12. Open the file by double left clicking on the file that represents the model number of the Atlas you are working on or highlight that file then choosing **Open**.

NOTE: *After opening the Atlas model# file you should see a Pangea screen similar to the window as shown in Figure 2-13.*

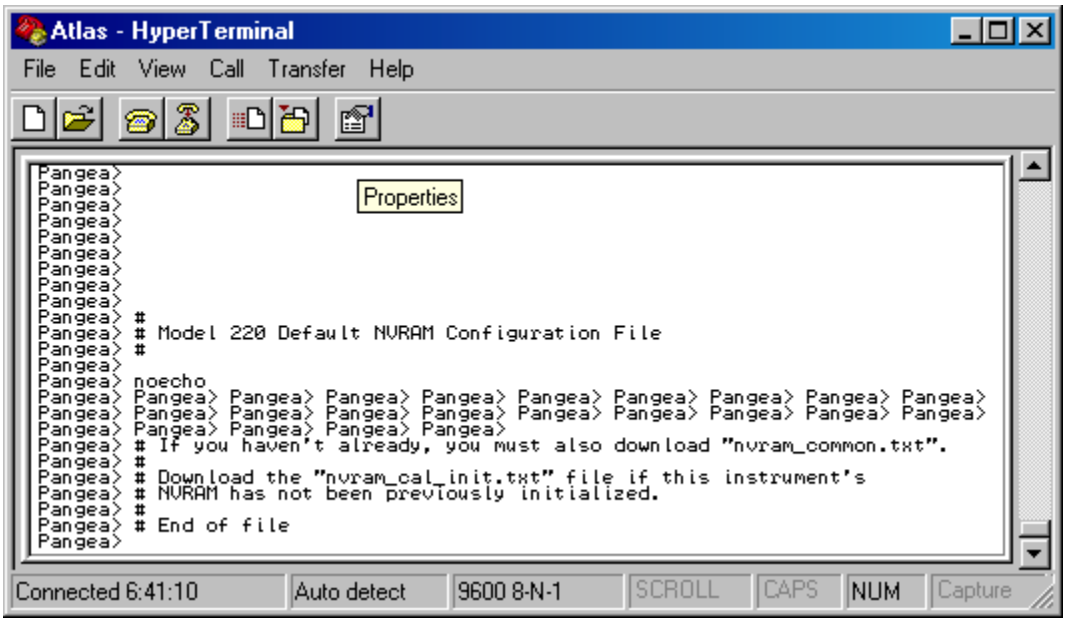

Figure 2-13. Pangea prompt after opening the model# file.

NOTE: *Next you will download the language(s) that you want the Atlas to store in it's Advanced Configuration menu for languages. You can have one or all the languages loaded in the Atlas. Listed in Table 2-4 are the language(s) choices and the files you will need to download to have the language(s) loaded in the Atlas. Each language you want loaded in the Atlas will require that the file associated with that language be loaded.*

Table 2-4. Files needed to download language(s).

Language	File needed to download
English	nvram_english.txt
French	nvram_french,txt
Spanish	nvram_spanish.txt
German	nvram_german.txt
Portuguese	nvram_portuguese.txt
Italian	nvram_italian.txt
Chinese	nvram_chinese.txt
Japanese	nvram_japanese.txt

13. Open the directory where the language files are located or open from CD.

14. Double left click on language.txt file or highlight the file and then choose **Open**.

NOTE: *After you download a language.txt file you should see a Pangea screen similar to Figure 2-14.*

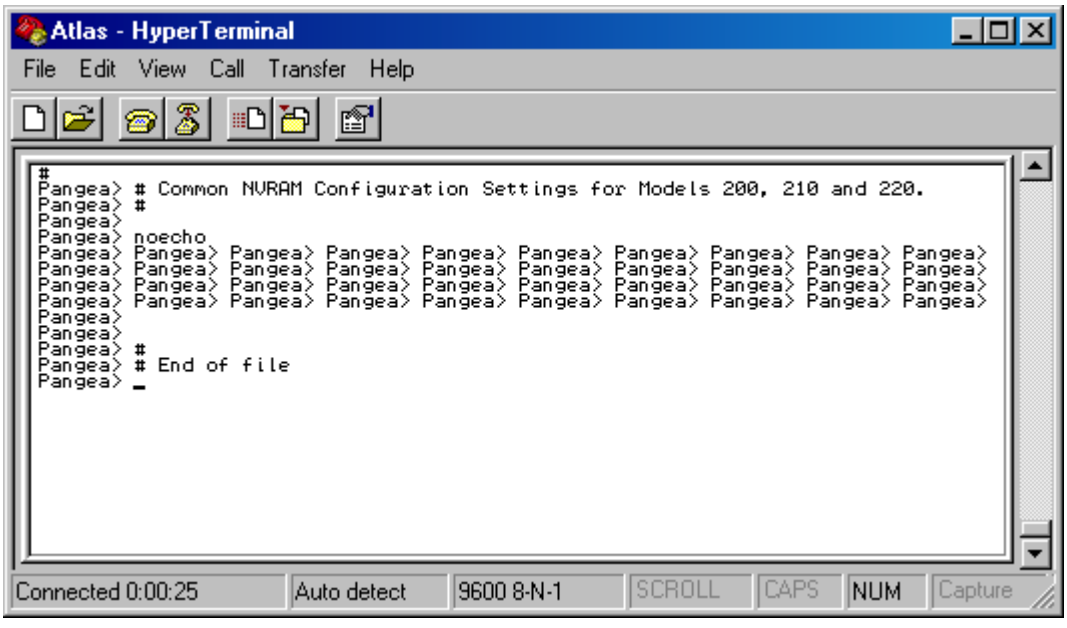

Figure 2-14. Pangea screen after loading a language file.

NOTE: *Next you tell the Atlas if it does or does not have a printer.*

1. *If the Atlas has a printer you will download the file* ***nvram_printer.txt****.*
2. *If the Atlas does not have a printer then you will download the file* ***nvram_no_printer.txt****.*

15. Open the directory where the printer.txt files are located or open from CD.

16. Double left click on the printer file or the no_printer file or highlight the printer file or the no_printer file and then choose **Open**.

NOTE: *After you have downloaded the printer or no_printer file you should see a Pangea screen similar to the window as shown in Figure 2-15.*

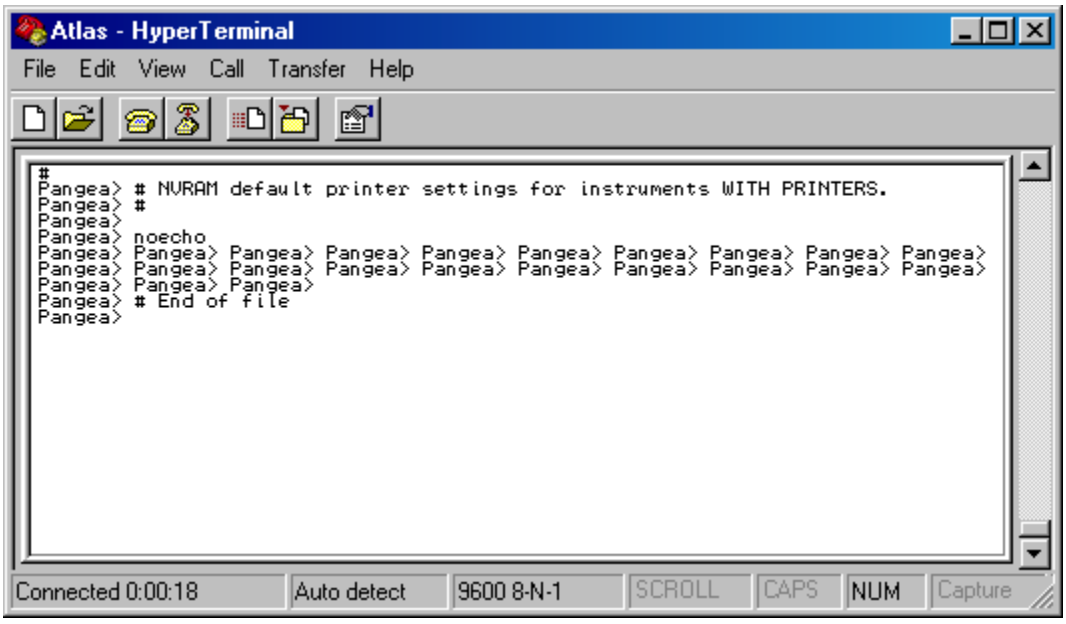

Figure 2-15. Pangea screen after downloading the nvram_printer.txt file.

NOTE: *The next three commands will require that you actually type the command at the Pangea prompt.*

NOTE: *XXXXX on line 17 is the Atlas 5 digit serial number. The serial number is located on the bottom of the Atlas. Make sure that you have a space between the command* ***serial*** *and the five numbers you are entering.*

17. At the Pangea prompt type the following command **"nvram set serial XXXXX"**<ENTER>

NOTE: *After you have typed the* ***nvram set serial XXXXX*** *command and hit* ***ENTER*** *you should see a Pangea screen similar to the example in Figure 2-16.*

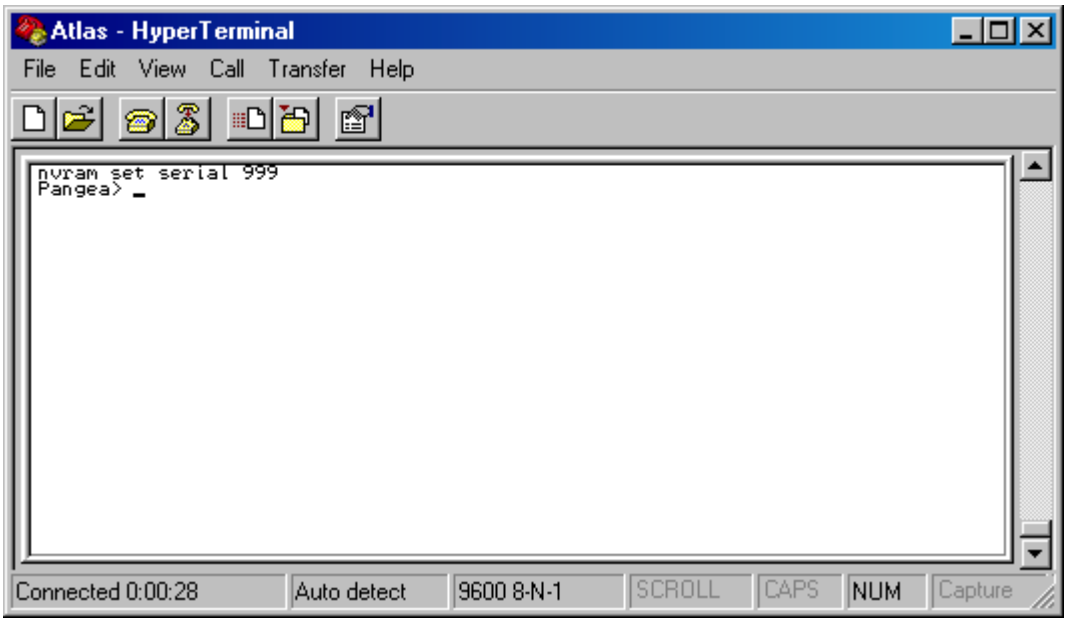

Figure 2-16. Pangea screen after you have downloaded the nvram set serial command.

NOTE: *To finish downloading the NVRAM files, type the next two commands at the Pangea prompt.*

18. At the Pangea prompt type the command **nvram write** <ENTER>.

19. At the Pangea prompt type the command **hw reset** <ENTER>.

NOTE: *The **hw reset** command will reboot the Atlas.*

*Remember that after you have download the files in this section and you **must** complete this entire "**Downloading NVRAM files**" section, that you **must** perform a complete calibration on the Atlas monitor.*

NOTE: *The firmware is not up grade able on the OEM boards (SpO_2 and CO_2) boards. If a higher version software is needed, then you will need to replace the OEM board.*

NOTE: *Review customer complaint and determine if it is safe to plug in the Atlas monitor into AC power and if it is safe to turn on!*

Power on Self Test

1. Plug in Atlas into AC power with no sensors attached. Verify that the *AC~ LED* indictor is lit. Install paper in printer if fitted.

2. Turn on power and verify the following:
    1. Green light in power button.
    2. Loud beep when **Power On** button pressed.
    3. Three dashes in SYSTOLIC.
    4. Three dashes in DIASTOLIC.
    5. Two dashes in SpO_2 (takes several seconds after BP dashes come on).
    6. Three dashes in PULSE (takes several seconds after BP dashes come on).
    7. Single bar at the bottom of Plethysmograph.
    8. No lights in TEMP.
    9. No lights in ALARMS OFF buttons.
    10. X lit on AUTO.
    11. CRT display may comes on slowly if cold or quickly if still warm from last use.
    12. May see version string in center if comes on quickly. It is not a problem if not seen because it comes on slowly.

3. On the CRT you should see:
    1. Three dashes for Heart Rate
    2. Heart symbol
    3. Lead select symbol
    4. Scale bar
    5. One or two lines of dashes for waveforms – depends upon settings.
    6. Three dashes for MAP – or blank, depending upon settings.
    7. Error message(s) at bottom of screen?

4. On models 622 or 623, disconnect AC cable. You should see no change except the *AC~ LED* indicator will not be lit. If you see warnings of a low, very low or depleted battery, or if the system turns off by it's self, plug the Atlas back into the AC outlet and let the unit charge with unit turned off. Repeat test in 2 hours.

5. Plug the monitor back into AC.

Menu Functional Test

1. Press **DATE/TIME** button to enter menu page. Press **TREND** button to access the Advanced Configuration menu.

2. Write down all configuration settings so that they can be reset to customer preferences later. If you have a printer press the **PRINTER** button to print out customer configuration settings.

3. Set language to your native tongue if necessary to allow you to write down the other settings. The top item is always the language, press either **SET** buttons to step through list.

4. Press **TREND** button to return to idle screen. Press **DATE/TIME** button and verify that date and time are correct. Set date and time if necessary.

NOTE: *An incorrect date may indicate a battery problem. If date was incorrect, turn off unit, disconnect AC power cable, wait 5 minutes then reconnect the power cable. Turn Atlas on. Check date again. If date comes back incorrect on model 621 then replace main board. On model 622 and 623, if battery was not dead then replace main board.*

5. Press **DATE/TIME** button to return to waveform screen if needed.

6. Press **DATE/TIME** button then press **LEAD SELECT** button to access service mode

7. Version/configuration data is in lower half of menu, write it all down.

8. Press **SELECT** button to highlight reset to factory defaults.

9. Press **BP START/CANCEL** button to reset configuration.

10. Press **TREND** button to return to idle screen.

11. Press **DATE/TIME** button then press **TREND** button to access the Advanced Configuration menu.

12. Set language to your native tongue if necessary

NOTE: *We have just reset the monitor to factory defaults. Compare settings to factory defaults appropriate for the country in Operator manual. If the factory defaults do not match then that may indicate a memory problem. Changing only the language should not change any of the other factory default settings.*

13. Press **DATE/TIME** button then press **LEAD SELECT** button to access service mode.

14. Press **SELECT** button to highlight CRT test pattern.

15. Press **BP START/CANCEL** button to show test pattern. Examine display. Press any key to end display.

16. Press **Select** button to highlight Printer test pattern (if fitted). Press **BP START/CANCEL** button to start test pattern. Printer should print a test pattern. Press any key to end display. Examine printout.

17. Press **SELECT** button to highlight LED test. Press **AUTO** button to turn on all LEDs. Press **BP START/CANCEL** button to show automatic test pattern. Watch for a while, look for glitches in pattern. Press **SET** button to go to manual mode and step through individual segments if needed to observe a problem.

18. Press **SELECT** button to highlight Button test. Press **BP START/CANCEL** button to start test. Press every button on system, press **BP START/CANCEL** button last. Verify that buttons match up with their names and that all buttons are functional.

NOTE: *If name does not correspond to the button pushed then this may indicate memory corruption. You may need to replace the main board.*

19. Press **SELECT** button to highlight Display A/D channels. Press **SET** button and write down all values for each of the four screens for later review. Press **TREND** button to return to Idle screen.

BP Test

1. Press **DATE/TIME** button then press **TREND** button to access the Advanced Configuration menu. Press **SELECT** button to highlight Initial pressure. Press **SET** button to change Initial pressure to 280 mmHg. Press **SELECT** button to highlight MAP. Press **SET** button to change MAP to Yes. Press **TREND** button to return to idle screen.

2. Connect the BP port to the BP simulator. Set the simulator for a normal reading (140/80, 100BPM, NSR). Press **BP START/CANCEL** button. Atlas should start to pump and display a manometer value in SYSTOLIC LED. This value should track and be very close to pressure displayed by manometer on BP simulator (if fitted). Largest number shown in SYSTOLIC LED should be very close to the initial pressure setting recorded above from Advanced Configuration. System should start stepping down pressure, showing step values in SYSTOLIC LED display. It then should display the correct SYSTOLIC and DIASTOLIC values. System may show MAP value depending upon country language setting.

3. Press **BP START/CANCEL** button. System should start pump, display manometer value in SYSTOLIC LED. This value should track and be very close to pressure displayed by manometer in BP simulator (if fitted). Largest number shown in SYSTOLIC should be very close to the Initial pressure setting of 280 mmHg. If pressure shown exceeds 300 mmHg then re calibrate the Atlas BP.

4. System should start to step down pressure, showing step values in SYSTOLIC LED and then display correct SYSTOLIC and DIASTOLIC values. System should show MAP value. MAP value should match what is shown by simulator.

5. Set simulator to (120/70, 60 (beats per minute)bpm, NSR).

6. Press the **AUTO** button. The X manual BP cycle indicator will go out and the 1 minute auto BP cycle indicator will flash for 10 seconds. 20 seconds after the 1 minute auto BP cycle indicator stops flashing, BP measurement starts.

7. Verify the BP reading. If BP measurement incorrect recalibrate.

8. No less than 30 seconds after completing the measurement another measurement should start. While it is pumping up, press the **BP START/CANCEL** button. Measurement should stop immediately and pressure should be dumped (as seen on the simulator manometer).

9. Press **AUTO** button and X manual BP cycle indicator should light (not flashing).

10. Disconnect the tubing from the BP port on the Atlas. Press **BP START/CANCEL** button and note the time (to the second) when the Atlas aborts the BP cycle and gives you an alarm. It should take no longer than 1 minute. Turn Atlas off.

Static Manometer Accuracy Test

Required materials.

1. Serial interface cable
2. PC with HyperTerminal (Windows 95 or above)
3. 500cc vessel with inflation system.
4. Calibrated manometer

1. Turn computer on and activate Hyper terminal.
   Hyper Terminal Settings are:
   9600 Baud, 8 bit word, 1 stop bit
   no parity, no flow control
   ANSI character set
   Start ⇨Programs ⇨ Accessories ⇨ Communication ⇨ HyperTerminal

2. Turn Atlas on. Refer to Figure 2.1 in Section 2 for inflation setup.

3. Enter the following commands at the PANGEA> prompt.
   PANGEA> **bp safety off** <ENTER>
   PANGEA> **bp valve close** <ENTER>

4. Pressurize the Atlas monitor to the applied pressures in Table 3-1.

5. To compare the applied pressure to the transducer readings use the following command.
   PANGEA> **bp press** <ENTER>

Table 3-1. Transducer pressure table.

Applied Pressure	Primary Transducer	Safety Transducer
0 mmHg	±0.75 mmHg	±1.0 mmHg
50 mmHg	±1.5 mmHg	±1.5 mmHg
150 mmHg	±1.5 mmHg	±4.5 mmHg
250 mmHg	±1.5 mmHg	±7.5 mmHg

6. Verify that the primary transducer and secondary transducer are within the specifications listed in Table 3-1.

NOTE: *The Atlas monitor will return a response to the computer screen as follows. If you tested at the 50mmHg pressure you would receive a message similar to: px = 5279, sx = 5305 x 0.01. Where px is the primary transducer and 5279 = 52.79 mmHg and sx is the secondary transducer and 5305 = 53.05 mmHg.*

BP Leak Test

NOTE: *Unit must not leak more than 5 mmHg in a 15 second interval while attached to a 100cc test cavity pressurized at 50 mmHg, 150 mmHg and 250 mmHg.*

Required Materials: 100cc test vessel (+10cc/-0cc), stopwatch, squeeze bulb, calibrated manometer.

1. Connect Atlas to 100cc test vessel and calibrated manometer as shown in Section 2, Figure 2.1.

2. Turn Atlas on.

3. Press **DATE/TIME** button then press **LEAD SELECT** button to access the Service Mode.

4. Press **SELECT** button and choose Verify manometer.

5. Pressurize the Atlas with squeeze bulb to 50mmHg and allow reading to stabilize.

6. Observe pressure for 15 seconds.

6. Unit should not leak more than 5mmHg during this time.

7. Repeat this process at 150mmHg and 200mmHg.

Over 15 mmHg Test

NOTE: *Atlas hardware must detect if the pneumatic system has been pressurized greater than 15 mmHg for more than 155 seconds but less than 180 seconds.*

Required Materials: 500cc test vessel (+10cc/-0cc), stopwatch, squeeze bulb, calibrated manometer.

1. Connect Atlas to 500cc test vessel and calibrated manometer as shown in Section 2, Figure 2.1.

2. Turn Atlas on. Press **DATE/TIME** button then press **LEAD SELECT** button to access the Service Mode. Press **SELECT** button and choose Verify manometer.

3. Pressurize the Atlas with squeeze bulb to any pressure above 15 mmHg and maintain that pressure during the test. Start the stop watch.

4. Verify that the valve opens and pressure drops between 155 seconds and 180 seconds.

5. Turn Atlas off.

BP Dump Verification Test

1. Connect the Atlas to a 500 cc vessel as shown in Section 2, Figure 2.1.
2. Turn Atlas on.
3. Press **DATE/TIME** button then press **LEAD SELECT** button to access the Service Mode.
4. Select Verify manometer.
5. Pressurize the Atlas to just over 260 mmHg.
6. Allow reading to stabilize for 15 seconds.
7. Ensure the reading is still over 260 mmHg.
8. Start the stop watch when you press the **SELECT** button. When the **SELECT** button is pressed the Atlas will start a pressure dump.
9. Verify that the pressure drops to below 15 mmHg within 10 seconds.

Hardware Fail Safe Tests

NOTE: *Atlas hardware must detect over pressure on unit pneumatic system between 296.0 mmHg and 330.0 mmHg.*

1. Connect the Atlas for testing as shown in Section 2, Figure 2.1
2. Turn Atlas on.
3. Press **CLOCK/DATE** button then press **LEAD SELECT** button to access Service Mode.
4. Press **SET** button to highlight the Manometer.
5. Pump system up and record at what pressure the Atlas dumps.

ECG/Respiration Test

NOTE: *Simulator should support ECG impedance respiration.*

1. Cycle power on Atlas, connect a 5 lead ECG cable set to the simulator. Configure the simulator for NSR, 100 bpm and set the impedance respiration rate to 20.

2. Press **DATE/TIME** button then press **TREND** button to access Advanced Configuration menu.

3. Press **SELECT** button to highlight ECG lead set and press **SET** button to select 5 wire.

4. Set ECG gain to Automatic, ECG speed to 25mm/s, ECG bandwidth to Monitor, Second trace selection to ECG.

5. Press **TREND** button to return to idle screen.

6. Verify you see: 1. ECG cascading onto second line
   2. Scale bar on top left of CRT
   3. Heart rate displayed as set on simulator
   4. Lead Selected = II
   5. Pulse tone high pitched

7. Press **LEAD SELECT** button and step through each of the lead settings. (I,II,III,aVR,aVL,aVF,V)

8. Verify that you see a different ECG waveforms for each lead selected. Heart Rate will go to dashes and alarms on some leads.

9. Set lead selected to II.

10. Press **DATE/TIME** button then press **TREND** button to access Advanced Configuration menu.

11. Change Second trace selection to Respiration. Press **TREND** button to return to idle screen.

12. Verify that you see:
    1. ECG on top line
    2. Scale bar on left of top line
    3. Heart rate displayed as set on simulator
    4. Lead Selected = II
    5. Pulse tone high pitched
    6. Respiration trace on second line and rate as set on simulator
    7. Respiration rate displayed on CRT as set on simulator.

13. Disconnect ECG simulator.

SpO_2 Test

1. Turn SpO_2 alarms on.

2. Connect SpO_2 cable to simulator.

3. Set simulator pulse rate to 60 beats/minute and verify that pulse rate is 60 ±3 beats/minute or 3%, whichever is greater.

4. Set SpO_2 between 70% and 100% and verify that SpO_2 is accurate ±2 digits.

Temperature Test

1. Without anything connected to the temperature connector on the Atlas, verify that the temperature LED is blank.

2. Using Table 3-2 below, connect the resistors to a 1/4 inch male mono plug and verify temperature readings.

Table 3-2 Resistor and temperature reference.

3. Connect the temperature probe to the Atlas monitor. You should see the display read room ambient temperature. Disconnect the probe and verify you see dashes is the display and that there are no alarms.

CO_2 Functional Test

1. Press **DATE/TIME** button then press **TREND** button to access Advanced Configuration menu

2. Set Second trace selection to CO_2.

3. Press **TREND** button to return to idle screen.

4. Insert watertrap with tubing attached.

5. Verify that you: 1. Hear pump motor start.
   2. See solid line waveform on lower trace.
   3. See dashes in Respiration Rate.
   4. See dashes in mmHg (or % or kPa, as configured).

6. Breathe gently and repeatedly over end of tubing.

7. Verify that you:
   1. See waveform within seconds of breathing.
   2. See respiration rate non zero within one minute.
   3. See CO_2 concentration non zero within one minute.

Battery Functional Test

1. System must have been plugged in for 24 hours to guarantee that the battery is fully charged. But, for now we can do a functional test as follows.

2. Press **DATE/TIME** button then press **LEAD SELECT** button to access Service Mode menu.

3. Press **SELECT** button to highlight Battery test.

4. Verify that the menu reports: 1. Battery Low Time XXX
   2. Battery Dead Time YYY

NOTE: *These are the results from the last battery test. The Battery Low Time is the time in hours and minutes that the battery ran in the last test until the Low Battery alarm started, and the Battery Dead Time is the time from the beginning of the Low Battery Alarm until the system turned itself off when the battery voltage reached the cutoff level.*

NOTE: *2:08 means 128 minutes which is the default setting indicating a battery test has never been made before.*

5. Write down the Battery Low Time and Battery Dead Time.

6. Unplug AC cord to start battery test.

7. The timers will begin the moment you unplug the AC cord. Leave the system on until it powers down by itself automatically. Plug Atlas into AC and turn the Atlas on, enter the Service Mode menu, select Battery Test again, and write down the new values. Compare these to the previous values, and to the minimum specification:
   1. Battery Low Time = 1 Hour
   2. Battery Dead Time = 10 Minute minimums

8. Replace the battery if performance falls below specification.

Printer Functional Test

NOTE: Configuration settings for printing are different for text pages than for waveforms.

1. Connect ECG simulator to generate a sample waveform.

2. Press **PRINT** button and look at waveform printout. Look for darkness, thickness of lines, legibility of text, blurring, “blooming” of text.

3. If waveform or printed text needs to be darker or lighter, go to Section 2, page 10 for printer calibration.

Print on Alarm Test

1. Turn the Atlas on.

2. Press the **DATE/TIME** button then press the **TREND** button to access Advanced Configuration menu. Press the **SELECT** button and scroll down to Print on Alarm. Press the **SET** button and set Print on alarm to No.

3. Connect an ECG simulator to the Atlas. Set the ECG rate on the simulator to 60 bpm, normal sinus rhythm.

4. Press left **SELECT** button and the HI heart rate alarm parameter will flash. Set the high heart rate alarm to 110 bpm on the Atlas and press the **SELECT** button again and the low heart parameter will flash. Press **SELECT** button one more time to return to the default screen.

5. Set the ECG simulator to heart rate to 120 bpm.

6. Verify that you hear the audio alarm and that the printer is not printing.

7. Set the ECG simulator to 60 bpm and make sure that the alarm condition has cleared.

8. Press the **DATE/TIME** button then press the **TREND** button to access Advanced Configuration menu. Press the **SELECT** button and scroll down to Print on Alarm. Press the **SET** button and set Print on alarm to Yes.

9. Set the ECG simulator to 50 bpm.

10. Verify that the printer printed a 15 second strip.

Software/Firmware

1. Review versions written down earlier and compare to latest available. Make sure that all components are compatible with each other. See section 2, page 26, Table 2-3.

ECG Alarms Test

1. Turn the Atlas on. Verify that you hear the power on tone.

2. Press **DATE/TIME** button then press **TREND** button to access Advanced Configuration menu. Press **SELECT** button and scroll down to Second Trace. Press **SET** button and set the second trace to ECG.

3. Connect ECG simulator to the Atlas. Set the ECG rate on simulator to 60 bpm, normal sinus rhythm.

4. Verify you hear the heart rate beep at a constant high pitch.

5. Press **SpO_2 - +** button "-" 8 times. Should get quieter and finally silent.

6. Press **DATE/TIME** button then press **PRINT** button to save settings.

7. Turn system off and back on.

8. Verify pulse tone is silent even though heart rate is shown.

9. Press **SpO_2** volume button **"+"** 8 times. Should get audible tone and then louder.

10. Disconnect ECG cable.

11. Verify you hear audio alarm and see error message "ECG Lead fault" and that you see the three LED bars flash where the heart rate was on the CRT.

12. Press **HR ALARMS Off** button.

13. Verify that the audio alarm stops and that the visual alarm on the CRT remains.

14. Press **HR ALARMS OFF** button. Connect ECG simulator to the Atlas and set simulator to normal sinus, 60 bpm.

15. Press left **SELECT** button and the HI heart rate alarm parameter will flash. Set the high heart rate alarm to 55 bpm on the Atlas and press the **SELECT** button again and the low heart parameter will flash. Press **SELECT** button one more time to return to the default screen.

16. Verify that you hear the audio alarm and that you see the numeric value flashing in the upper right portion of the monitor.

17. Return the high alarm limit to 120 bpm and press **SELECT** button. Verify the audio alarm should is silent and the numeric visual alarm is flashing.

18. Press **SELECT** button twice. Verify the numeric low alarm parameter is flashing.

19. Set the LOW alarm for 65 bpm by pressing the up **SET** button. Press **SELECT** button.

20. Verify that you hear the audio alarm and that you see the numeric value is flashing in the upper right portion of the monitor.

21. Turn the Atlas off.

Respiration Alarms Test

1. Turn Atlas on.

2. Press **DATE/TIME** button then press **TREND** button to access Advanced Configuration menu. Press **SELECT** button to scroll down to Second Trace. Press **SET** button and set second trace to respiration. Press **TREND** button to return to default screen.

3. Set respiration on simulator to 20 respirations/minute and connect to the Atlas.

4. Press left **SELECT** button three times and set the hi respiration alarm to less than 20. Wait 10 seconds and the CRT will return to the default screen.

5. Verify that you hear the audio alarm and that the respiration numeric value on the CRT is flashing.

6. Press **CO_2/RESP ALARMS** off button.

7. Verify that the audio alarms are silent, the visual numeric alarm is flashing and that the red LED in the **CO_2/RESP ALARM off** button is lit.

9. Press left **SELECT** button three times to access hi respiration alarms and set hi alarm to 30.

10. Wait ten seconds and the CRT will return to the default screen.

11. Press **CO_2/RESP ALARM off** BUTTON then press left **SELECT** button four times to access low respiration alarms and set low respiration alarms to 25.

12. Wait 10 seconds and CRT will return to the default screen.

13. Verify that you hear the audio alarm and that the respiration numeric value on the CRT is flashing.

14. Press **CO_2/RESP ALARMS off** button.

15. Verify that the audio alarms are silent, the visual numeric alarm is flashing and that the red LED in the **CO_2/RESP ALARM off** button is lit.

16. Turn Atlas off.

SpO_2 Alarm Test

1. Turn Atlas on.
2. Attach SpO_2 to a simulator and set for 95% SpO_2.
3. Verify that you hear a pulse rate beep and that it is a different pitched tone than the ECG pulse beep.
4. Change SpO_2% setting on the simulator. Verify that tone changes pitch up or down tracking simulator setting.
5. Press lower far right **SELECT** button until SpO_2 LO is flashing, press right **SET** button UP to change SpO_2 LO setting to 99.
6. Wait until the SpO_2 LO LED stops flashing.
7. Verify that you hear the SpO_2 LO limit alarm.
8. Press **Alarm Volume** button **"-"** eight times. Verify tones gets quieter but not silent.
9. Press **Alarm Volume** button **"+"** eight times. Verify the tone gets louder.
10. Disconnect SpO_2 cable from simulator and verify that the visual alarm "SpO_2 cable not detected" is displayed on the bottom left side of CRT. Verify that you hear the audio alarm.
11. Press **SpO_2 ALARMS Off** button.
12. Verify that the audio alarm sound is silent, that you do not see the visual alarm message "SpO_2 cable not detected" on the CRT and that the LED in the SpO_2 ALARMS OFF button is on.
13. Turn Atlas off.
14. Disconnect SpO_2 cable from Atlas.

Silence Alarm Test

1. Turn Atlas on.

2. Press **DATE/TIME** button then press **TREND** button to access Advanced Configuration menu. Press **SELECT** button until Silence Duration is highlighted. Press **SET** button until 90 seconds is highlighted. Press **TREND** button to go to default screen.

3. Connect ECG simulator to the Atlas. Set the ECG rate on simulator to 60 bpm, normal sinus wave.

4. Press left **SELECT** button once and set the HI alarm to 55 bpm.

5. Wait until you hear the audio alarm.

6. Press **SILENCE** button and start stopwatch. Verify that the alarm returns at 90 seconds.

7. Turn Atlas off.

CO_2/RESP Test

1. Turn Atlas on.

2. Press **DATE/TIME** button then press **TREND** button to access the Advanced Configuration menu.

3. Set Second trace selection to CO_2.

4. Press **TREND** button to return to idle.

5. Insert CO_2 watertrap with hose.

6. Breath into hose until a waveform is displayed.

7. Remove CO_2 watertrap .

8. Verify you hear the audio alarm and that you see in the visual alarm " CO2 watertrap not detected" in the bottom left portion of CRT.

9. Press the **" CO_2/RESP ALARMS off "** button. Verify that the audio alarm goes silent, the visual alarm goes out and the red LED in the **CO_2/RESP ALARMS off** button is lit.

10. Turn Atlas off.

Blood Pressure Alarm Test

1. Turn Atlas on.

2. With no hose connected to the BP port, press **BP Start/Cancel** button.

3. Place finger over BP port. This will block the flow causing the Atlas to detect an over pressure.

4. Verify that you hear the audio alarm, that the visual alarm " Check Blood Pressure Cuff " appears in the lower left portion of the CRT and that the SYSTOLIC and DIASTOLIC LED displays are flashing.

5. Press the **BP ALARMS OFF** button.

6. Verify the audio alarm is silent, the visual alarms have turned off and that the red LED in the **BP ALARMS OFF** button is lit.

7. Press the **BP ALARMS OFF** button then press the **BP START/CANCEL** button twice.

8. Press **BP START/CANCEL** button and let Atlas run without anything attached to the BP port.

9. Verify at 60 seconds that you hear the audio alarm and that the visual alarm " Check Blood Pressure Cuff " appears in the lower left portion of the CRT and that the SYSOLIC and DIASTOLIC LED displays are flashing.

10. Press the **BP ALARMS OFF** button.

11. Verify the audio alarm is silent, the visual alarms are still off and that the red LED in the **BP ALARMS OFF** button is lit.

12. Press the **BP ALARMS OFF** button then press the **BP START/CANCEL** button twice.

13. Connect a BP simulator to the Atlas BP port. Set the simulator for a normal reading (140/80, 100 bpm, normal sinus rythym).

14. Press the right **SELECT** button twice and the current SYSTOLIC HI alarm value will be flashing.

15. Press the **SET** button to set SYSTOLIC HI alarm to 130.

16. Press **BP START/CANCEL** button.

17. Verify that you hear the audio alarm and that the numeric value in the SYSTOLIC LED display is flashing.

18. Press the **BP ALARMS OFF** button.

19. Verify the audio alarm is silent, the numeric value in the SYSTOLIC LED display is still flashing and that the red LED in the **BP ALARMS OFF** button is lit.

20. Reset the SYSTOLIC HI alarm to 200 (factory default). Press **BP ALARMS OFF** button.

21. Press the right **SELECT** button three times and the numeric value in the SYSTOLIC LO alarm LED display will be flashing.

22. Press the **SET** button to set the SYSTOLIC BP LO alarm to 160.

23. Press **BP START/CANCEL** button.

24. Verify that you hear the audio alarm and that the numeric value in the SYSTOLIC LED display is flashing.

25. Press the **BP ALARMS OFF** button.

26. Verify the audio alarm is silent, the numeric value in the SYSTOLIC LED display is still flashing and that the red LED in the **BP ALARMS OFF** button is lit.

27. Reset SYSTOLIC LO alarm to 70 (Factory default). Press **BP ALARMS OFF** button.

28. Press right **SELECT** button four times and the numeric value in DIASTOLIC HI alarm LED display will be flashing.

29. Press the **SET** button and set DIASTOLIC HI alarm to 70.

30. Press **BP START/CANCEL** button.

31. Verify that you hear the audio alarm and that the numeric value in the DIASTOLIC HI LED display is flashing.

32. Press the **BP ALARMS OFF** button.

33. Verify the audio alarm is silent, the numeric value in the DIASTOLIC LED display is still flashing and that the red LED in the **BP ALARMS OFF** button is lit.

34. Reset DIASTOLIC hi alarm to 155 (Factory Default).

35. Press right **SET** button five times and the numeric value in the DIASTOLIC LO alarm LED display will be flashing.

36. Press **SET** button and set DIASTOLIC LO alarm to 90. Press **BP ALARMS OFF** button.

37. Press **BP START/CANCEL** button.

38. Verify that you hear the audio alarm and that the numeric value in DIASTOLIC LED display is flashing.

39. Press the **BP ALARMS OFF** button.

40. Verify the audio alarm is silent, the numeric value in the DIASTOLIC display is still flashing and that the red LED in the **BP ALARMS BUTTON** is lit.

41. Reset DIASTOLIC LO alarm to 50 (Factory Default).

42. Turn Atlas off.

Table 3-3. Atlas trouble shooting.

Failures		Possible Solutions
Power on:		
Unit does not power up, no AC on LED, no Power on LED.	1	Check AC power cord.
	2	Verify connection from power supply to main board.
	3	Verify +12V output from power supply.
	4	Replace Power Supply.
	5	Check Cable from main board to display board.
	6	Replace Display board.
Unit does not power up - AC and Power on LED on.	1	Check that the CPU board is fully seated.
	2	Replace CPU board.
	3	Check for conformal coating in J4 header - replace board if coating is found.
	4	Replace Main board.
	5	Replace Display board.
Unit powers up intermittently or Power button sticks or cannot duplicate power on problem But unit passes burn in.	1	Remove flashing on Bezel at power button.
	2	Check for severely tipped power button LED on display board.
Unit powers up - but no image on CRT.	1	Check for conformal coating in J4 header - replace board if coating is found.
	2	Replace CPU board.
	3	Check for correct installation of connection from main board to deflection board. If installed with pin 1 in the pin 2 socket deflection board will be damaged. If installed with pin 1 out of socket deflection board will be OK.
	4	Replace CPU assembly.

Table 3-4. Atlas trouble shooting.

Failures		Possible Solutions
Display:		
Segment out, LED out, Buttons do not work.	1	Replace Display board.
All or most segments stay on at power up.	1	Replace CPU board.
	2	Check cable from Display board to Main board.
	3	Replace Power Supply.
CRT:		
CRT image rotated or poor alignment.	1	Rotate yoke and/or adjust magnets.
Only see a dot in the center of the screen.	1	Check cable from yoke to CRT board.
Only see a horizontal line in the center of the screen.	1	Check cable from yoke to CRT board.
	2	Replace Deflection board.
No image - CRT to Main board connection OK.	1	Check flex-cable from Deflection board to tube.
	2	Check high voltage anode connection.
	3	Replace Deflection board.
	4	Replace tube.
	5	Replace CPU board.
No image - Glow at bottom of screen.	1	Check for conformal coating in J4 header - replace board if coating is found.
	2	Replace CPU board.
Dark vertical scan lines in image.	1	Replace CPU board.

Table 3-5. Atlas trouble shooting.

Failures		Possible Solutions
Printer:		
Motor does not run.	1	Check that the unit is configured for printer. (CRT image will freeze for 10 seconds if configured for no printer.)
	2	Check cable from printer PCB to motor.
	3	Check cable from printer PCB to Main board.
	4	Check motor gear alignment to first plastic gear.
	5	Check for paper jam.
	6	Replace printer PCB.
	7	Replace CPU.
Motor runs or chatters - paper does not advance.	1	Check for missing dowel pin in roller.
	2	Check for missing bearings/gears.
	3	Replace printer PCB.
	4	Replace CPU.
Light print or no print.	1	Check that paper is properly installed (thermal side visible).
	2	Check cable from printer PCB to print head.
	3	Check printer-strobe-width in NVRAM (could indicate error in printer thermistor circuit). If low, check printer PCB, Main board, and CPU board.
	4	Check mechanical assembly for proper force of printhead on paper.
Prints gibberish.	1	Reseat CPU board.
	2	Replace CPU board.
	3	Replace Printer to Main board cable.
	4	Replace printer PCB.

Table 3-6. Atlas trouble shooting.

Failures		Possible Solutions
Safety:		
Earth resistance over limit.	1	Check ground wire from motor to power supply can.
	2	Tighten screws that attach ground tabs to power supply can.
	3	Tighten screws holding power supply PCB to can.
	4	Tighten quick connects on AC harness to power supply.
	5	Replace power supply PCB.
Blood Pressure:		
Leak test - Fails Leak Specification	1	Run individual test. If unit passes repeat all tests.
	2	Check seals @ tubing in BP assembly.
	3	Check for lifted pins on the CPU connector JP8.
	4	Replace Check valve.
Leak test - 'Can't pump beyond xxx.xx'.	1	Verify unit can pump beyond 300 mmHg then: Retest.
	2	If pump will not reach 300 mmHg, then: A. Check for correct direction on check valve. B. Check for possible leaks. C. Check for pinched tubing. D. Replace pump.
Manometer Accuracy - 'Can't pump beyond xxx.xx'.	1	Verify unit can pump beyond 300 mmHg then: Retest.
	2	If pump will not reach 300 mmHg, then: A. Check for correct direction on check valve. B. Check for possible leaks. C. Check for pinched tubing. D. Replace pump.
	3	Check for lifted pins on the CPU connector JP8.

Table 3-7. Atlas trouble shooting.

Failures		Possible Solutions
Manometer Accuracy - Fails Accuracy Specification.	1	Replace Main board. Faulty transducer or amp.
Deflation Profile.	1	Replace dump valve.
	2	Replace Main board. Valve drive circuitry fault.
Overpressure Limit - 'Can't pump beyond xxx.xx'.	1	Verify unit can pump beyond 300 mmHg then: Retest.
	2	If pump will not reach 300 mmHg then: A. Check for correct direction on check valve. B. Check for possible leaks. C. Check for pinched tubing. D. Replace pump.
Overpressure Limit - Fails Accuracy Specification.	1	Replace Main board. Fault with pressure transducer, amplifier, or comparator.
	2	Replace CPU board.
Dwell time.	1	Replace Main board. - Fault with 15 mmHg detect circuit.
	2	Replace CPU board. - Fault with timer.
Dwell Pressure.	1	Replace Main board- If fault with 15 mmHg detect circuit.
	2	Replace CPU board.

Table 3-8. Atlas failure trouble shooting.

Failures		Possible Solutions
SpO2:		
No Signal - SpO2 fault message on CRT.	1	Plug in finger cuff, connect to your finger & check for function. If function is normal retest. If not continue to step 2.
	2	Check cables - SpO2 board to Main board, SpO2 board to Bezel.
	3	Replace Main board.
	4	Replace SpO2 board.
	5	Replace CPU board.
SpO2 signal accuracy.	1	If Nellcor, check ribbon cable and harness. Replace as needed.
	2	Replace SpO2 board.
ETCO2:		
Specification limits fail - Flow rate or Percentage.	1	Perform calibration. If that does not fix then go to step 2.
	2	Replace Pryon board.
ETCO2 failure.	1	Check for broken switch in trap receptacle.
	2	Verify board ID in service module.
	3	Perform functional test of ETCO2. Verify pump comes on when switch in water trap receptacle is activated. If switch is intermittent replace the receptacle.
	4	Replace Pryon board.
	5	Replace CPU board.
Temperature:		
	1	Check connection - main board to temperature jack.
	2	Check pins in Temperature harness for correct seating.
	3	Replace Main board.

About Section 4

This section is a guide for disassembly and reassembly of the Atlas Monitor. Always refer to current revision schematics, diagrams and final safety test procedures before attempting to service this device.

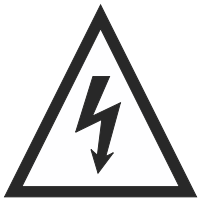
Do not attempt to service this instrument unless you have received Service Training from Welch Allyn or an authorized Training Agent, and are equipped with approved processes and test equipment. For more information about training call the Welch Allyn Customer Service phone number listed in Section 1 of this manual.

General:
The outside housing is removable in order to provide full access to all internal printed circuit boards and other components. Most of these are held in position with the surrounding "E-Pac" foam. E-Pac foam provides shock absorption, ventilation channels, and spaces for the components and boards. Pneumatic tubing and cables must be placed correctly in E-Pac to avoid problems with pinched tubing.

Problems During Service:
A Technical Support phone number is listed in Section 1 of this manual to answer questions you may have during the servicing of the Atlas Monitor.

Printer:
Print-head, printer motor, and printer roller can be replaced as necessary.

Printed Circuit Boards:
There are no component level repairs for the Printed Circuit Boards(PCB). These are replaced if found to be defective. During the warranty period, boards that are found to be defective should be returned to Welch Allyn.



CAUTION

Electrical Shock Hazard

EXERCISE EXTREME CAUTION WHEN SERVICING THE ATLAS MONITOR! THE CRT ASSEMBLY AND CRT DEFLECTION BOARD OPERATE ON APPROXIMATELY 8,000 VOLTS.

CRT:
The CRT and CRT Deflection Board are aligned at the factory and as such are replaced as a matched set if one or the other should fail in service.

ESD: Circuit Boards are sensitive to static electricity. Use wrist straps, ESD mats and ESD storage bags.

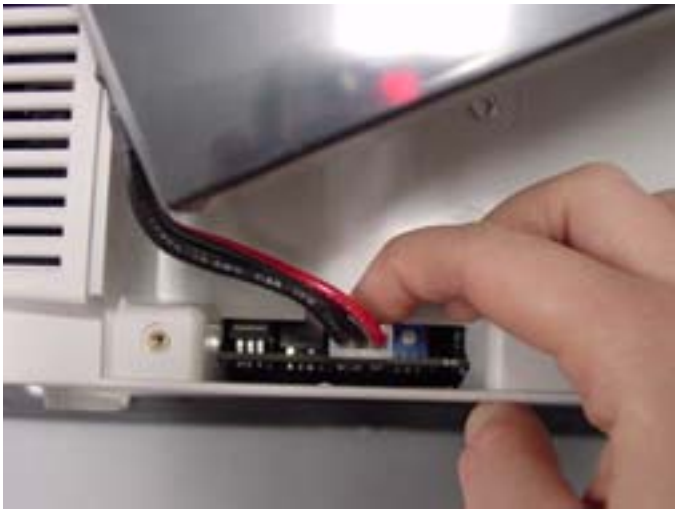
Model 220 (623NP)

1. Battery Door Removal

Remove the two screws holding the battery door. Remove the battery door.

2. Battery Removal

Remove the battery connector from the main PCB. Remove battery.



3. Rear Housing Removal

3.1 Remove the four Torx head machine screws. Use a #10 Torx driver.

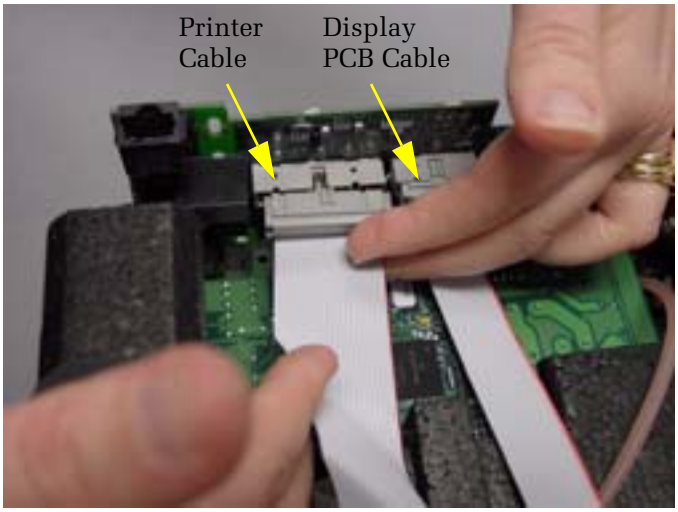
3.2 Pull the rear housing away from the front panel. Take special care not to damage any cables.

3.3 Flip the housing forward. Take special care not to damage any cables.

NOTE: *Observe how hose fits in E-Pac Foam. The hose fits over wiring keeping wiring secure.*

4. Printer cable and Display Cable Removal

Remove both Printer and Display PCB cables from the Main PCB.

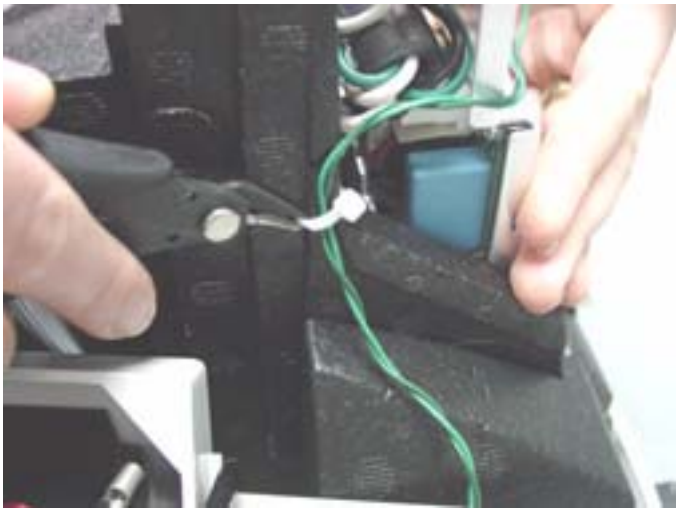


5. Power Supply Ground Wire Removal

Remove the two ground connectors from power supply chassis.

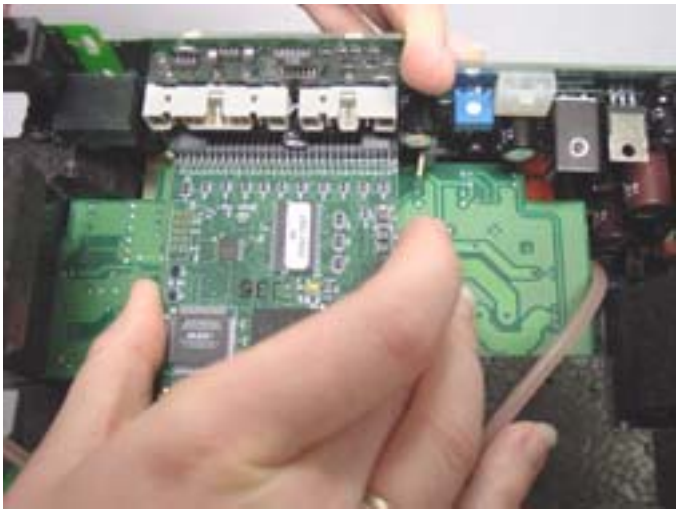
6. Tie Wrap Removal

Cut the tie wrap that secures the ground wires to the E-pac foam.



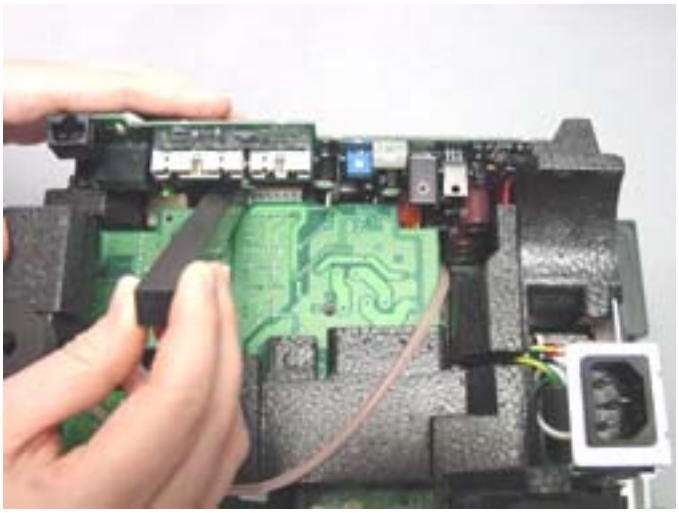
7. CPU Removal

Remove the CPU from the Main PCB.



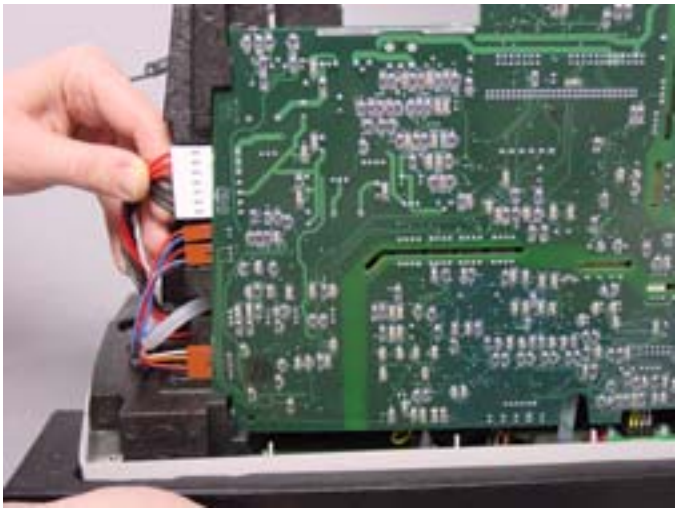
8. Main PCB Removal

Use a tool T-16654 to pry the main Board away from the Deflection Board. Pull the E-pac tab to the right as you pry. Support the Main PCB while titling it away.



9. Main PCB Side Connector Removal.

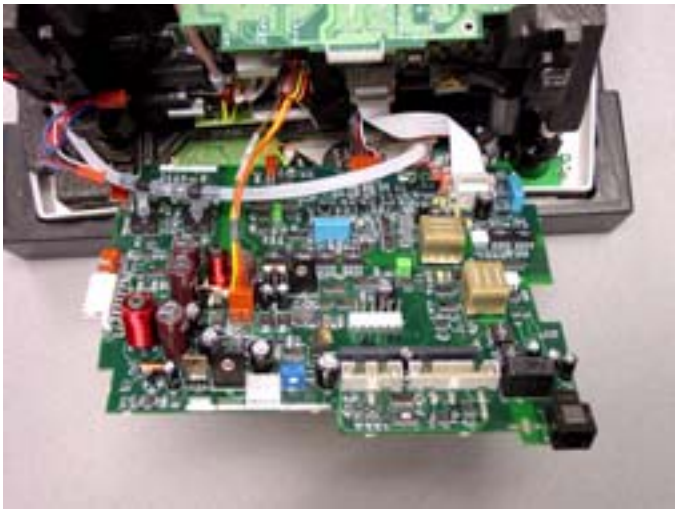
Remove the four connectors(power supply, fan, speakers, BP pump) from the side of the main PCB.



10. Main PCB Hose and Wire Removal.

Disconnect hoses and connectors. BP hose, ecg cable, temp cable (modles 622 and 623 only, SpO_2 cable, CO_2 cable (model 623 only)and ground wire (Nelcor SpO_2 only) from main PCB.

***NOTE**: Notice how hoses and connectors fit on Main PCB.*



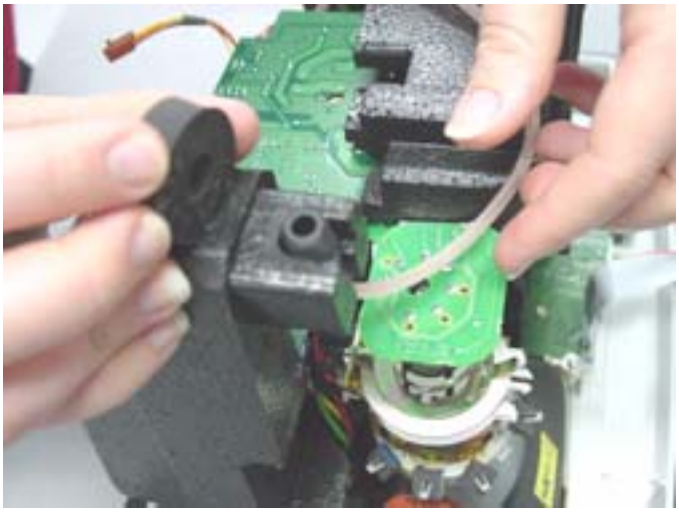
11. Pump Removal.

Remove the pump assembly from the E-Pac foam.

***NOTE:** Notice how pump fits in E-Pac Foam and how wires are routed out of pump.*

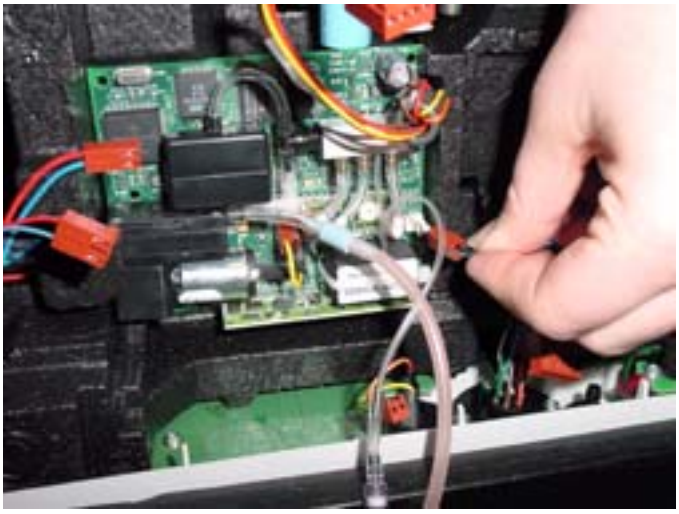
12. CO_2 Exhaust Removal.

Remove the CO_2 exhaust cover and remove the CO_2 connector from the E-Pac foam.



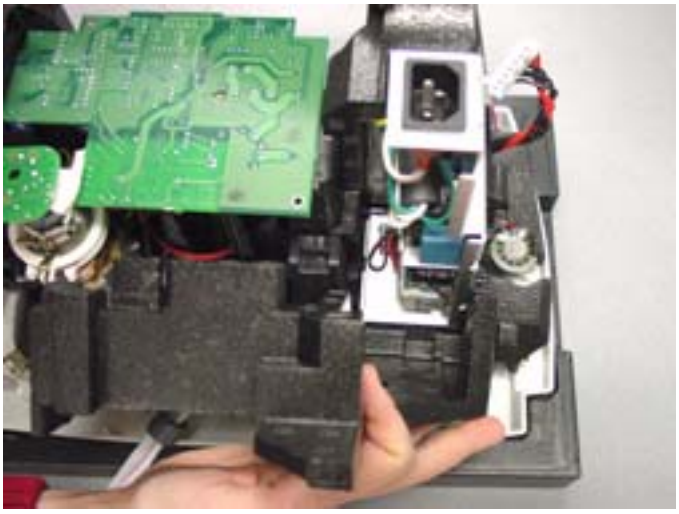
13. Pryon PCB Removal.

Remove connectors from Pryon PCB. Pull Pryon PCB from E-Pac foam.



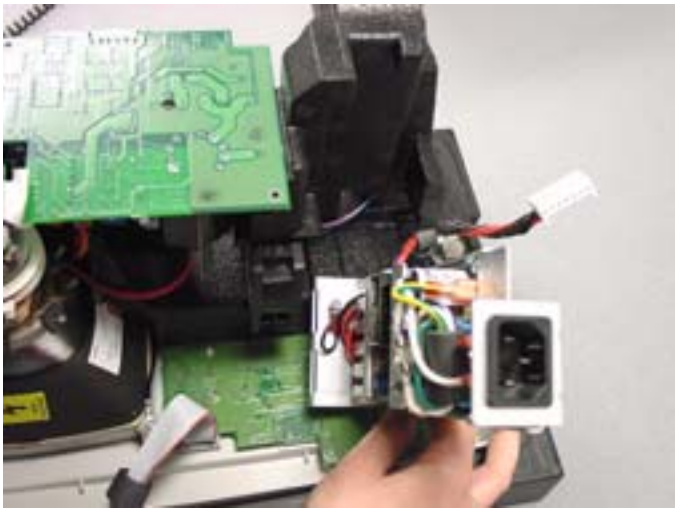
14. E-Pac Foam Removal (Top).

Remove the top E-Pac foam.



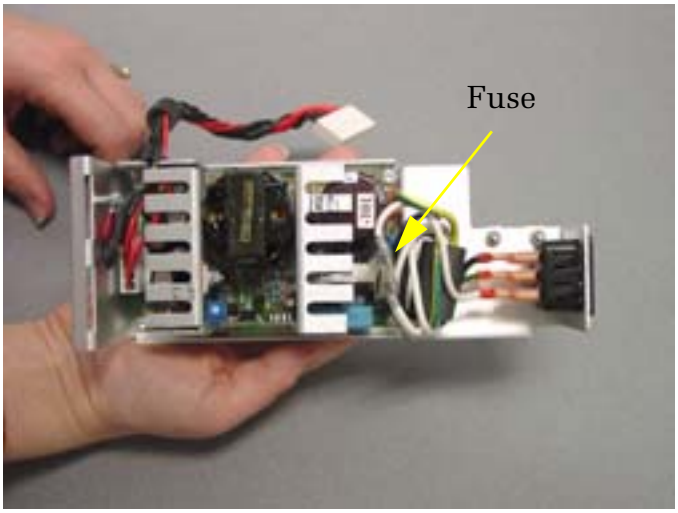
15. Power Supply Removal.

Slide the power supply out from the E-Pac Foam.



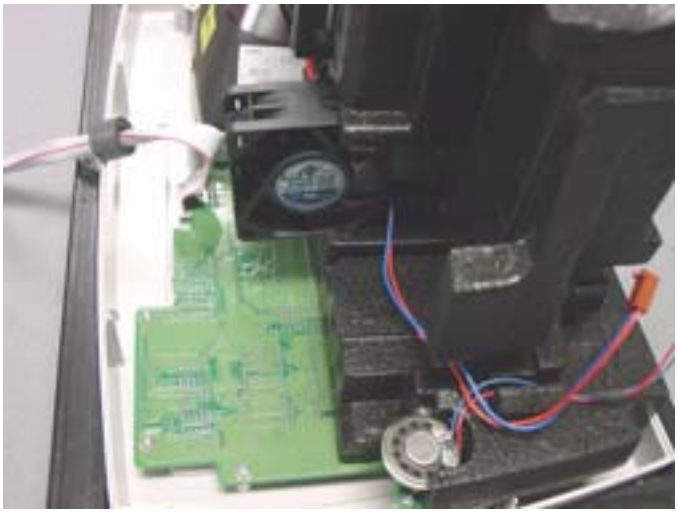
16. Power Supply Fuse Location

NOTE: *Notice power supply and power supply fuse location.*



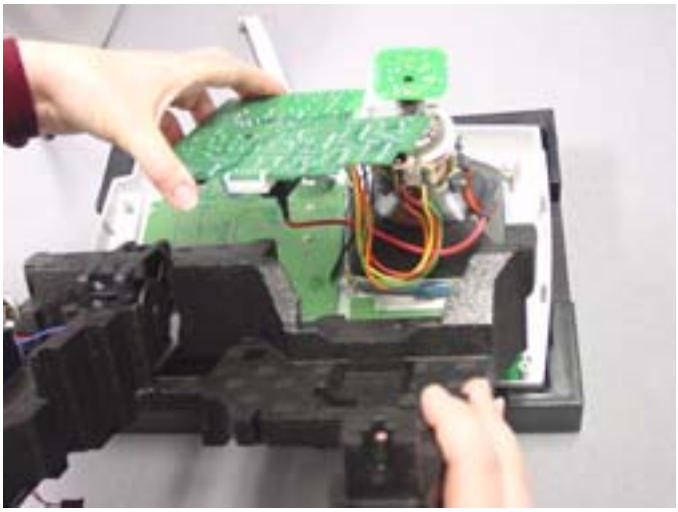
17. Fan Removal

Slide fan out from E-Pac foam.



18. E-Pac Removal (Lower)

Remove lower E-Pac foam from unit.



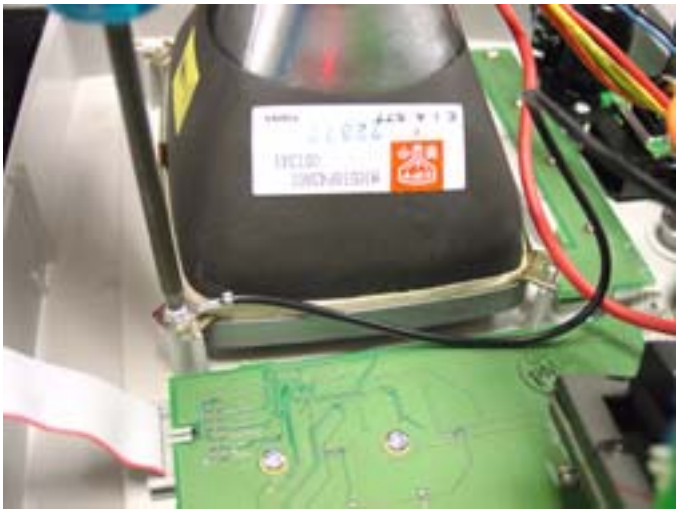
19. Deflection PCB Removal

Carefully remove the small deflection PCB from the CRT.

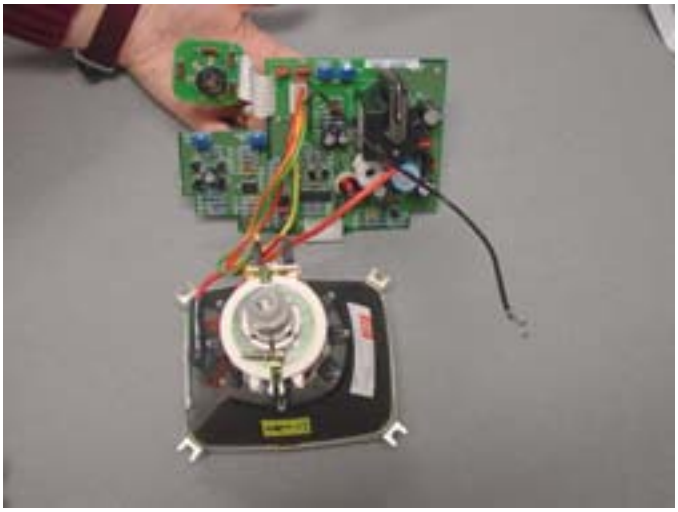
20. CRT Removal

Remove the two machine screws holding CRT to the front panel.

NOTE: *Notice how the ground wire is attached and is located along the side of CRT.*



NOTE: *The CRT and deflection PCB are factory tuned as a unit and are sold only together as a unit.*



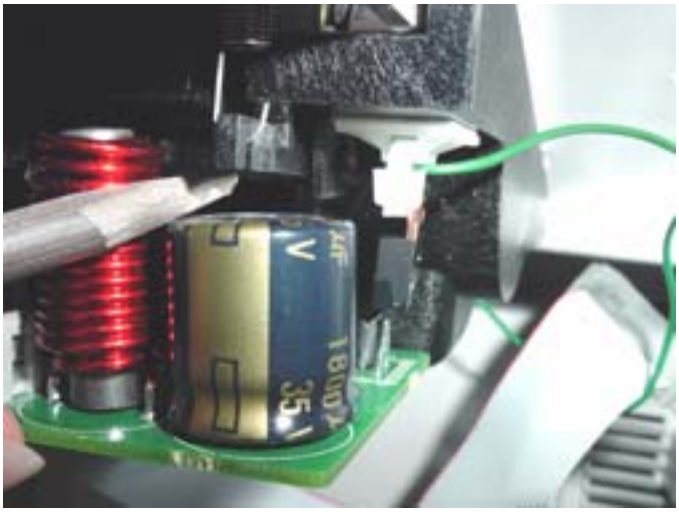
21. Display PCB Removal

Remove all 9 self tapping screws that hold the Display PCB to the Bezel.

NOTE: *Notice the correct orientation of CRT screw and washer.*

22. Printer Door Button Removal

Use a small screwdriver to push the door button tab up and away from the pin that locks it onto the printer frame.

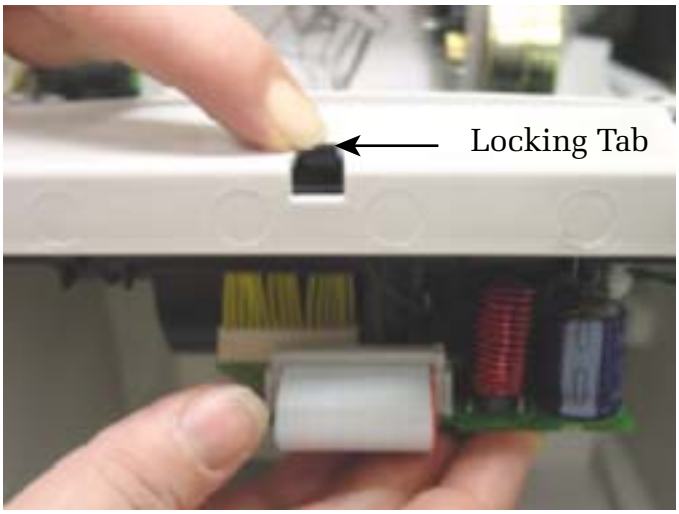


NOTE: *Notice how the printer button is being removed.*

.

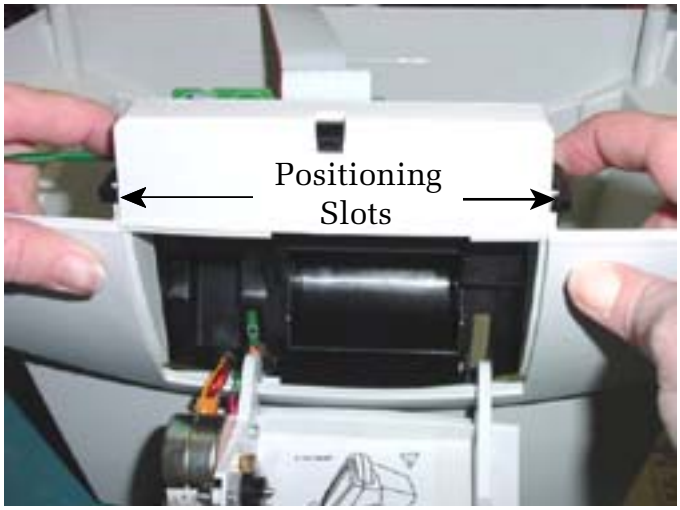
23. Printer Assembly Locking Tab Release.

Pull the locking tab down and towards the front of the rear housing assembly.



24. Printer Positioning Slot Removal

Make sure printer door is open. Begin to pull the positioning slots towards the front of the rear housing and then out from the rear housing.



25. Printer Assembly Removal.

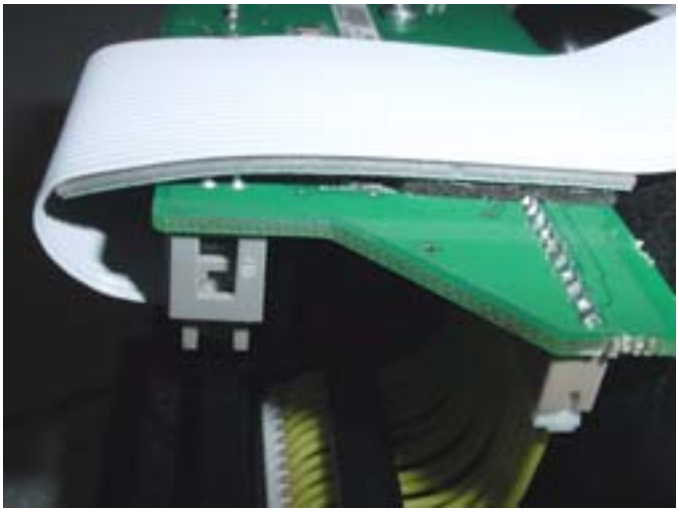
After printer positioning slots have cleared the front rear housing, pull the printer down and out of the rear housing.

26. Printer Lip Assembly.

Observe how the printer assembly fits into the lip of the rear housing.

27. Printer Cable Routing.

Observe how the printer cable lies over the printer PCB.



Power Supply Circuits

Model 621

Atlas Model 621 uses a 50W, medical grade, offline switcher which provides 12VDC from a universal AC input (85VAC to 264VAC – 50/60Hz). The model 621 can only be powered from external AC.

The following supplies are generated on the Atlas Main Board:

+12V DC	CRT, input to isolated power supply, misc. analog circuits.
6V DC	NIBP Pump and Valve, input to 5V and 3V regulators (5.7V nom).
+5V DC	Front panel LED's, misc. logic.
+3.3V DC	CPU board.
Vbackup:	On/Off circuits.

Note: *Additional electrically isolated supplies are generated for patient connected circuits.*

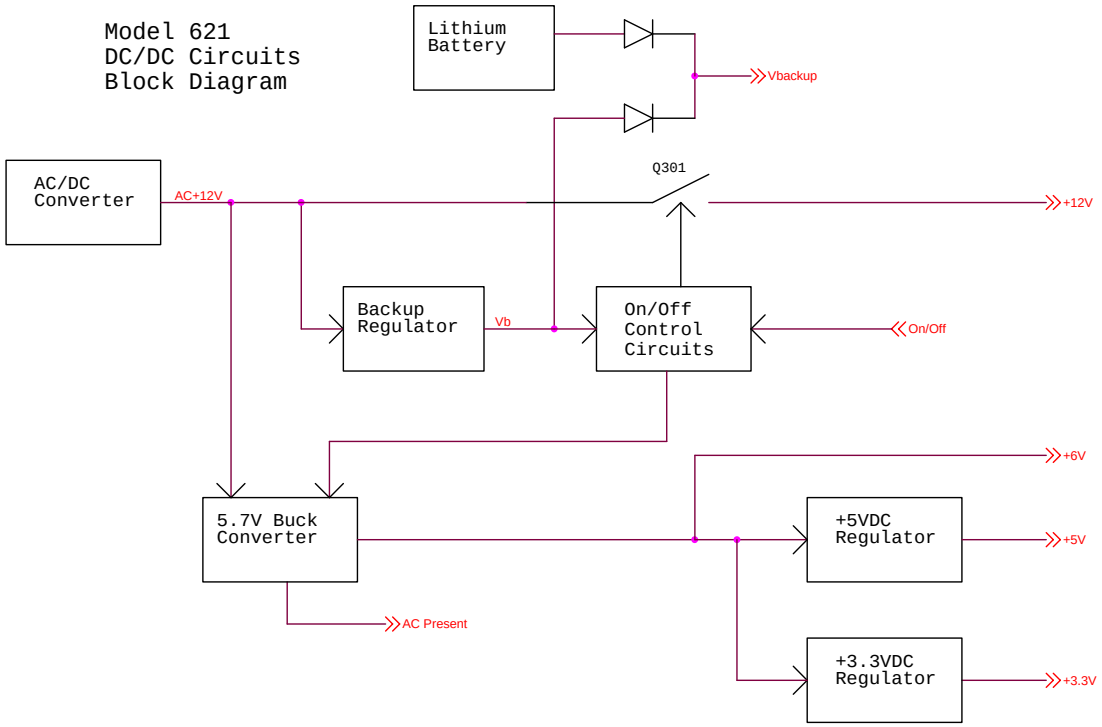


Figure A-1. Model 621 DC/DC circuit block diagram.

On/Off Circuits – Backup Regulator and Micro-Controller

A 3.3V regulator, U304, provides power to the On/Off circuits. This voltage is diode OR'd (D304) with the lithium backup battery to provide power to the real time clock on the CPU board. The On/Off circuitry is controlled by the micro controller U305. This controller performs the following functions:

1. Monitors the status of the front panel ON-OFF key. If the unit is off and the ON-OFF key is pressed, the controller will drive U10-6 high, which will enable power to the remainder of the instrument.

2. At power up, the micro controller will drive the beeper for about 1 second.

3. At power up, the micro controller will reset Shift Register U2. This will cause the following:

a. The front panel LED's are blanked.
b. The NIBP pump drive is placed in the off state.

4. When the unit is ON the micro controller will communicate with the system CPU. When the front panel ON-OFF key is pressed, the CPU will store away current operating conditions, then issues a command to the micro controller to shut instrument power off. U10-6 is driven low which will remove power from the remainder of the instrument.

The instrument is powered on as follows:

U305-6 is driven high, which turns transistor Q302 on (output low)
Q301 (P-channel MOSFET) ON when the gate is pulled low, then +12V active.
Q306 is turned off, allowing the 5.7V buck converter to power on.
As 5.7V becomes active, the 5V and 3.3V supplies also become active.

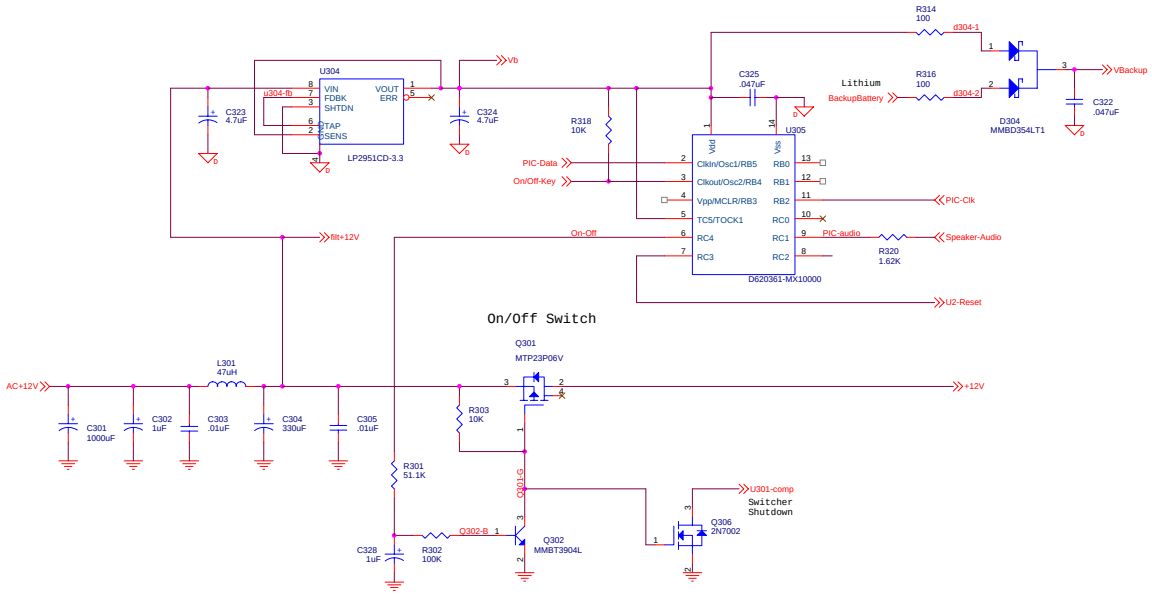

Figure A-2. On/Off Control Circuits.

Buck Converter

A buck converter is used to generate 6V from the 12VDC output of the offline switcher. The UC3843A (U301), normally a current mode controller, is configured for voltage mode feedback. The UC3843A has an under-voltage lockout for Vcc<8.5V. The controller operates such that with Vcc less than 8.5V, the reference out is 0V, and will be at 5V with Vcc>8.5V.

Then, the reference out (pin 14) can be used as an AC-ON detection signal.
The switching transistor for the buck converter is a P-Channel MOSFET (Q305). The output drive of the controller is the wrong polarity for driving a P-Channel MOSFET in a step down mode. Therefore, transistor Q303 is added to invert the PWM out signal. Fast turn-on of Q305 is provided when Q303 is low, fast turn-off is though Q304 (configured as an emitter follower). The PWM controller includes an internal 2.5V reference. Voltage regulation is controlled with sampling resistor R304 and R305 such that Vout = 2.5V*(1+R304/R305) = 5.68V. At power down pin U301-1 (comp pin) is pulled low. This will cause U301-10 to go low, which turns Q305 off and disables power to +6V.

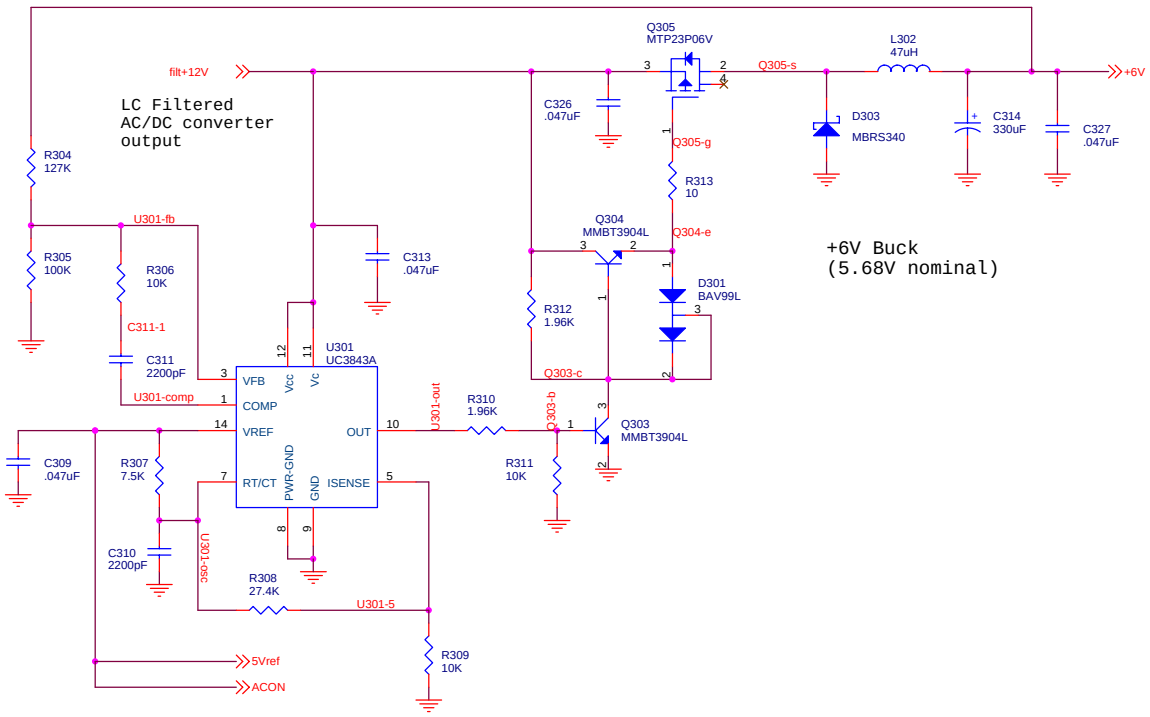

Figure A-3. Model 621 Buck converter.

Linear Regulators – 5VDC and 3.3VDC

Three terminal linear regulators, U302 and U303, are used to develop regulated 5V and 3V. The regulators are powered by the output of the 6V PWM converter. These regulators do not include a power down mode, but the voltage will collapse as the input voltage shuts down.

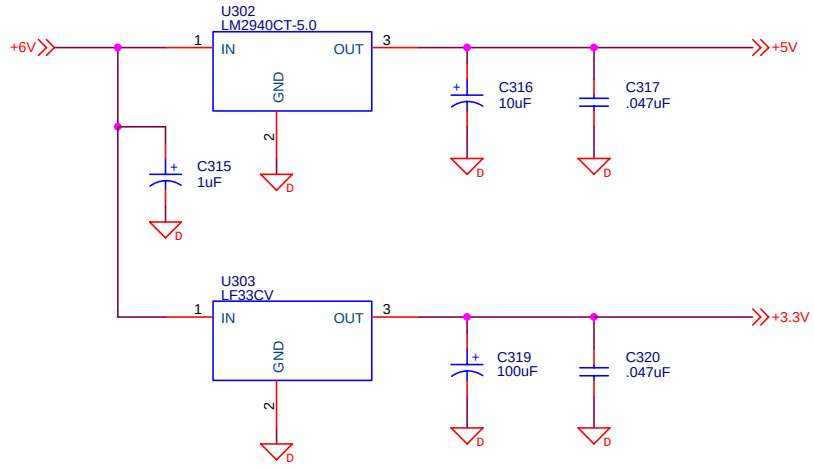

Figure A-4. Model 621 linear regulation.

Model 622 and Model 623

Atlas Model 622 and 623 can be powered either from AC or battery. A 50W, medical grade, offline switcher provides 12VDC from a universal AC input (85VAC to 264VAC – 50/60Hz). The battery is a rechargeable 6-Volt, 6.5 Amp-Hour, Sealed Lead Acid Battery, and will provide about 1.5 hours on a fully charged battery (Battery Life depends on usage, especially printer usage, NIBP cycles, and CO2 operation).

The unit will operate from AC when the unit is plugged in, and switches to battery operation when AC is removed. The battery is automatically charged whenever AC is connected.

The following supplies are generated on the Atlas Main Board:

+12V DC	CRT, CO2, input to isolated power supply, misc. analog circuits.
+5V DC	Front panel LED's, misc. logic.
+3.3V DC	CPU board.
3.3V Backup:	Real time clock and On/Off circuits.
Battery Charger:	Charges SLA battery.

Note: *Additional electrically isolated supplies are generated for patient connected circuits.*

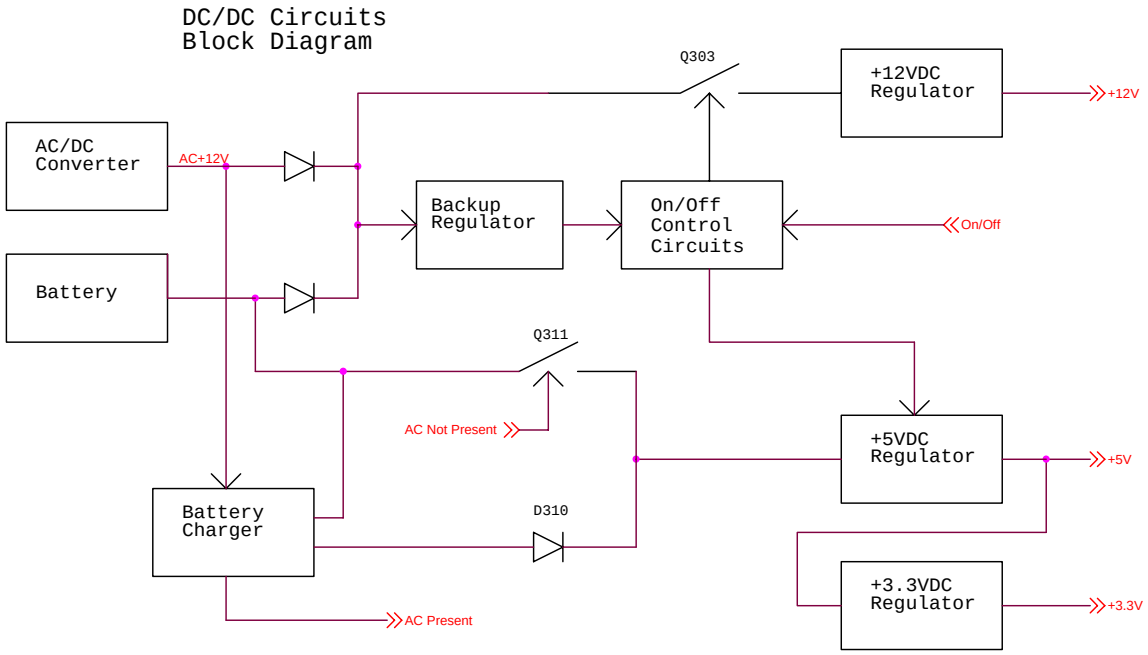

Figure A-5. DC/DC circuit diagram.

On/Off Circuits

Backup Regulator and Micro-Controller

A 3.3V low current regulator, U307, provides power to the On/Off circuits and to the real time clock on the CPU board. The On/Off circuitry is controlled by the micro controller U10.

This controller performs the following functions:

1. Monitors the status of the front panel ON-OFF key. If the unit is off and the ON-OFF key is pressed, the controller will drive U10-6 high, which will enable power to the remainder of the instrument.

2. At power up, the micro controller will drive the beeper for about 1 second.

3. At power up, the micro controller will reset Shift Register U2. This will cause the following:
   a. The front panel LED's are blanked.
   b. The NIBP pump drive is placed in the off state.

4. When the unit is powered on the micro controller will communicate with the system CPU. When the front panel ON-OFF key is pressed, the CPU will store away present operating conditions, then issues a command to the micro controller to shut instrument power off. U10-6 is driven low which will remove power from the remainder of the instrument.

18V boost converter and FET ON/OFF switch

The PWM controller, U301, is configured as an 18V boost-converter. An N-Channel MOS-FET transistor, Q303, is used to switch power to the 12V regulator. As Q303 is configured as a high side switch, it is necessary to develop a gate voltage of proper magnitude to turn Q303 on. Then, to enable power to the 12V regulator, the following takes place:

1. The micro controller drives U10-6 high, turning transistor Q302 on.
2. Transistor Q301 is switched on, supplying power to the PWM controller, U301.
3. The boost regulator develops 18VDC, which will switch transistor Q303 On.

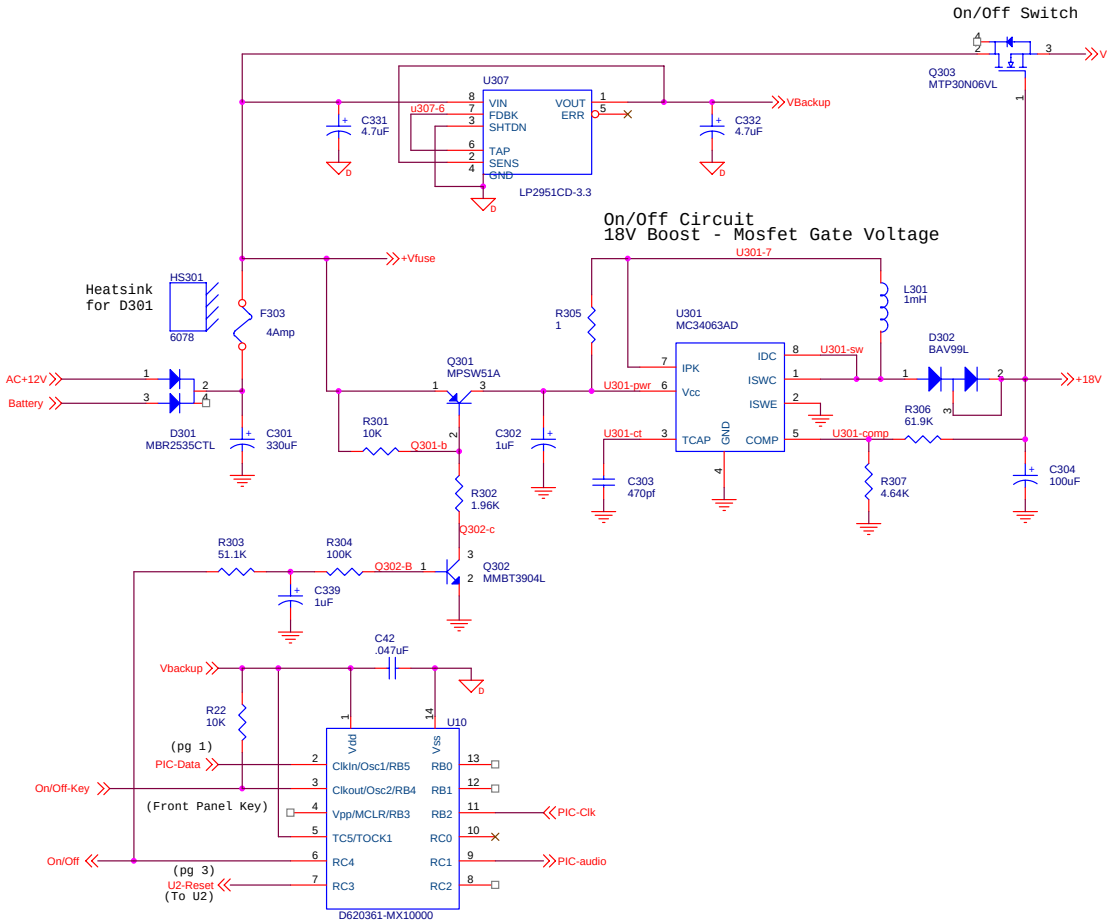

Figure A-6. Boost converter and off/on switch.

+12V Boost Converter

The +12V boost circuit provides regulated 12VDC. The input to the 12V converter is either battery or 12V from the AC/DC converter. The circuit is configured as a boost PWM using current mode feedback. The PWM controller is a UC3843A. The controller includes an internal 2.5V, 2% reference, and an external 5V, 2% reference. Nominal output voltage for the boost converter is Vout = [2.5V*(1 + 173.8K/4.64K)] = 12.1V.

The UC3843A requires 8.5V minimum to power on. The maximum voltage allowed on the switching transistor, Q305, is 15V. To meet both these requirements, the UC3843A is powered from 12.9V (+18V – 5.1V zener diode D303)

When operating from battery, the converter will run at duty cycles over 50%, which requires slope compensation for a current mode controller. Slope compensation is achieved by summing in part of the oscillator signal (pin 4) with the current sense line.

The PWM controller is current limited on a cycle to cycle basis by monitoring the voltage on the Isense line, U302-5. Current limit is activated when the voltage at the sense line reaches 1V. The nominal DC voltage at Isense is about 0.5V when operating from battery only, and 0.7V when operating from AC. Then, current limit is set to 5Amps when Atlas in operating on battery and 3Amps when operating on AC.

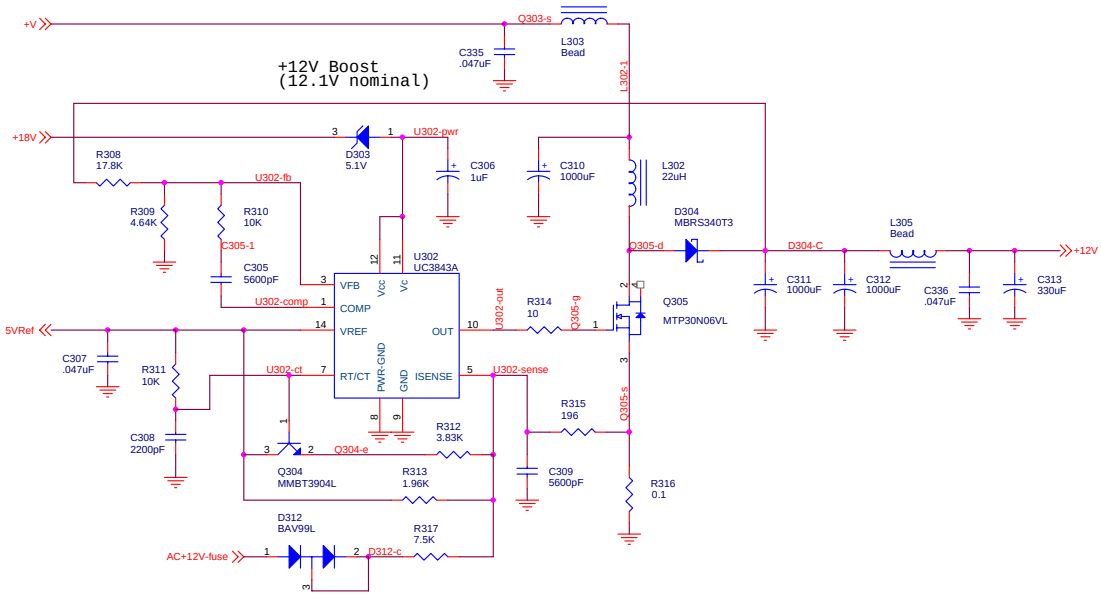

Figure A-7. Boost converter.

Battery Charger

The battery charger is a PWM buck converter. The input to the battery charger is 12VDC from the offline switcher. The UC3843A, normally a current mode controller, is configured for voltage mode feedback. The UC3843A has an under-voltage lockout for Vcc<8.5V. The controller operates such that with Vcc less than 8.5V, the reference out is 0V, and will be at 5V with Vcc>8.5V. Then, the reference out (pin 14) can be used as an AC-ON detect signal.

The switching transistor for the buck converter is a P-Channel MOSFET (Q308). The output drive of the controller is the wrong polarity for driving a P-Channel MOSFET in a step down mode. Therefore, transistor Q306 is added to invert the PWM out signal. Fast turn-on of Q308 is provided when Q306 is low, fast turn-off is though Q307 (configured as an emitter follower).

The battery charger is a current limited - temperature compensated charger. Current limit is set to 1.5Amps. Current through the 0.1Ohm sense resistor R327 is measured with Diff-Amp U305B. When the charger current is at 1.5Amps, feedback is controlled by Op-Amp U304A. When the current drops below 1.5Amps, the output of U304A goes low, reverse biasing Diode D308, and feedback will be controlled by Op-amp U304B.

Battery charge voltage is temperature compensated using Thermistor RT301, a 10K negative temperature coefficient resistor. Voltage over temperature follows the following charge profile:

Table A-1. Temperature coefficient.

Temperature	Voltage	Thermistor
0C	7.05V	26.9K
10C	7.0V	20.7K
25C	6.85V	10K
40C	6.7V	5.17K
50C	6.65V	3.45K

For optimum battery life, the float voltage (25C, full charge) should be set to 6.85V +/- 50mV (6.85V +/- 0.7%). To accomplish this tight tolerance, charge voltage at room temperature will be adjusted with potentiometer R328. Nominal charge voltage at room temperature is:
Vcharge = 5V * (1 + RA/RB) where,
5V is the reference in U303.
RA is the series/parallel combination of R335, R336, and RT301 (nominal 3.465K @ 25C).
RB is the series combination of R337and R338 (nominal 936 Ohms)

It is necessary to minimize current out of the battery when the unit is off. To reduce off current, transistor Q309 disconnects the battery from the battery sense resistors when AC in off. In addition, diode D307 is added to prevent current from flowing from the battery into the battery current sense circuit, and to the output of the AC/DC converter.

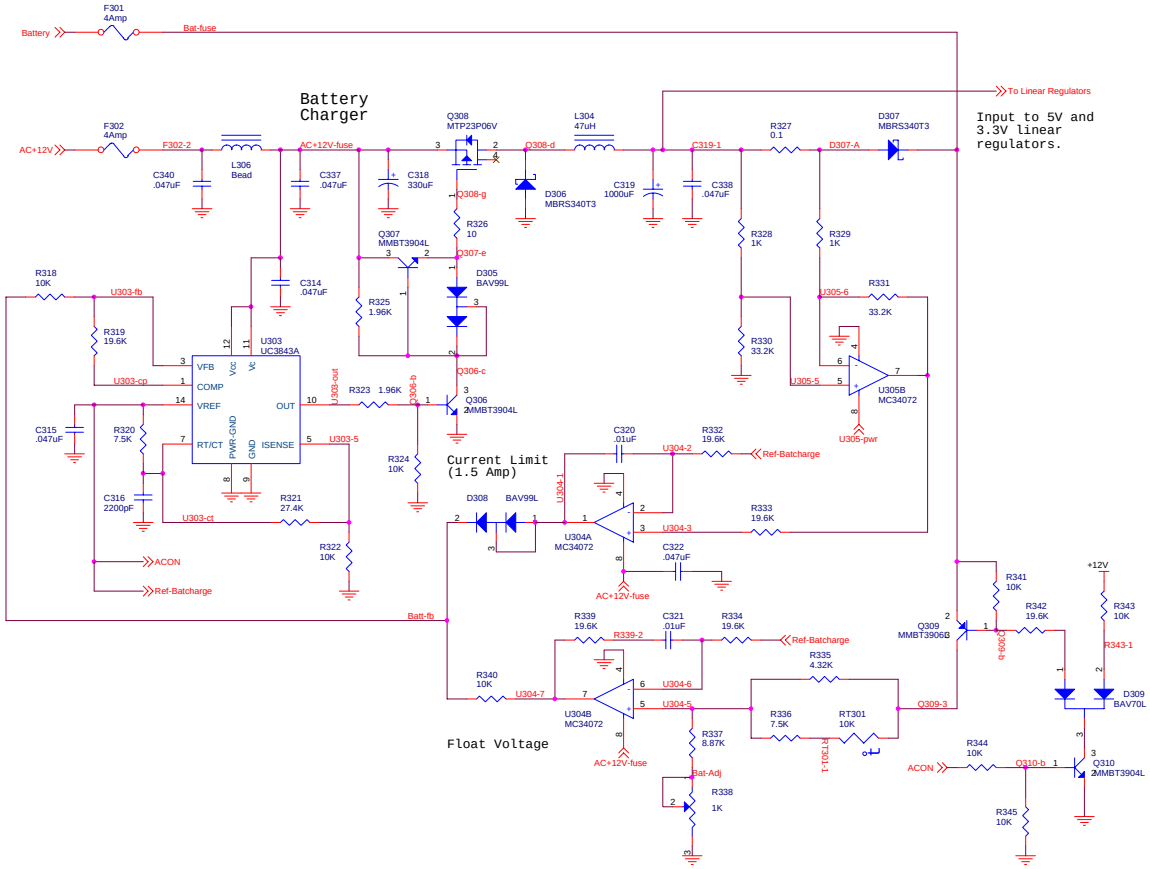

Figure A-8. Battery charging.

Linear Regulators – 5VDC and 3.3VDC

A series pass 5V regulator is built using transistor Q312 and op amp U305A. A 5V reference from U302 PWM IC) is used as the control voltage for the regulator. The output of the 5V regulator is turned off when the unit is turned off. When the 18V-boost circuit is shut down, power is removed to U302, then the U302 reference is driven to 0V. Setting the reference to 0V will cause op amp U305 to turn the series pass transistor Q312 off.

When operating from AC, transistor Q310 is turned on, which will turn transistor Q311 off. Power to the 5V regulator is then provided through Diode D310 from the output of the battery charger circuit. Note that this voltage tap is before the current sense resistor, then load current on +5V does not affect the battery charger current limit circuit. When AC is removed, the AC-On signal goes low, and Q310 turns off. The gate of Q311 is then pulled up to 11.4V (12V – Vdiode). Transistor Q311 then turns on, and the 5V regulator is powered from the battery.

3.3VDC is derived using a three terminal regulator. The output of the 5V regulator is used to power the 3.3V regulator. The 3.3V regulator does not have an independent shutdown, but powers down as the 5V regulator shuts down.

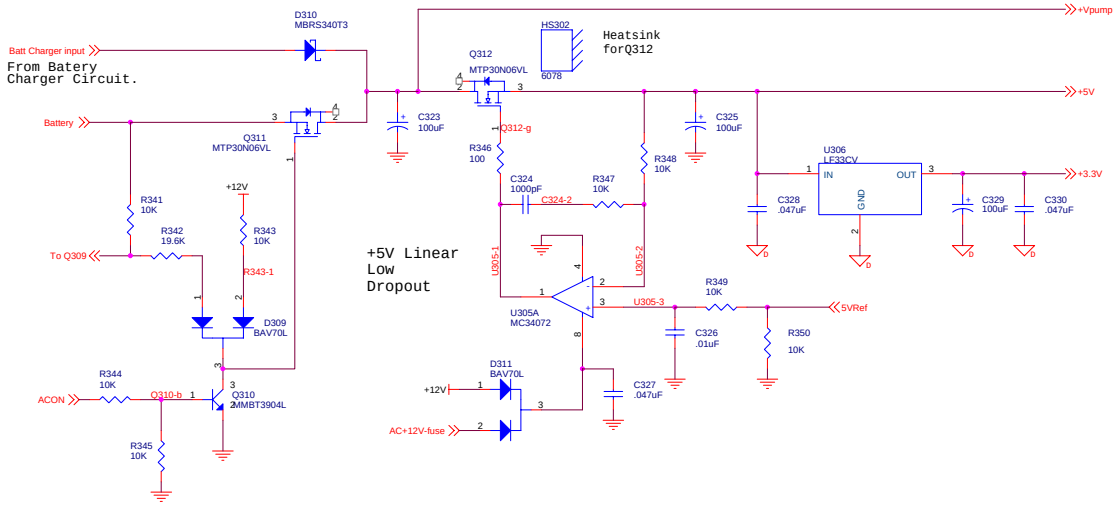

Figure A-9. Linear regulator.

A/D – grounded circuits

The A/D converter is designed by building a pulse width modulator (PWM) and a timer circuit. The PWM runs at a 1.2KHz rate, synchronized by the A/D sync signal (NIBP-ADC-Clock). A/D sync is low for 52.1uSec, high for 781.25uSec. Component values are selected such that the integrator will ramp down 4.7V, and ramp up 7.83V. The voltage at the integrator output (U601-1) is limited to about 5V [5V*(73.2/83.2) + Vdiode)]. Then, the integrator starts at 5V and ramps linearly down to 0.3V.

The analog input voltage to be digitized and the integrator output are the inputs to comparator U210. The output of the comparator is low at the start of an A/D cycle, and switches high as the integrator ramp drops below the input voltage being digitized (see the timing diagram below). A/D conversion is accomplished by measuring the width of the PWM output signal. The A/D timer runs at 25.175MHz, then the A/D resolution is about 21000 counts (over 14 bits). Note that since the output of the comparator is low at the start of the A/D cycle, a resistor divider is formed at the comparator input. This divider reduces the Analog-In signal by 0.75% [464K/(464K+3.48K)].

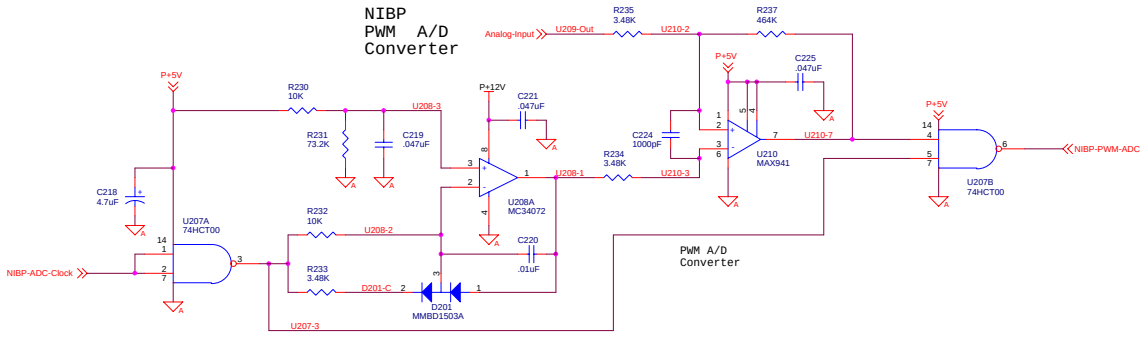

Figure A-10. NIBP PWM A/D converter.

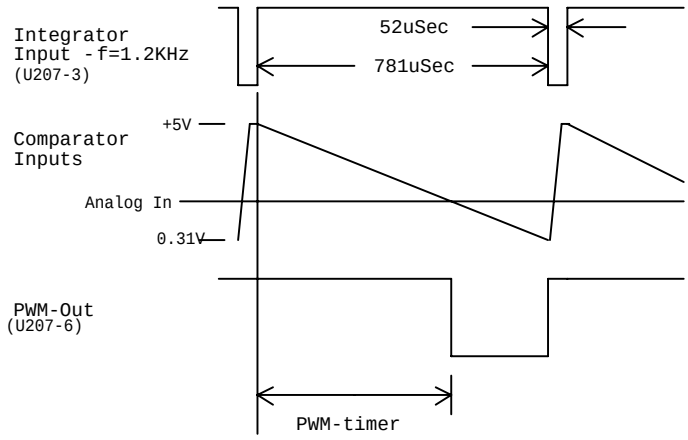

Figure A-11. PWM timing.

A/D Mux – grounded circuits

Analog signals are switched to the A/D converter through MUX U209. Control of the multiplexer is through a serial communication channel from the main CPU. The following signals are digitized:

+5V/2	Sampled version of the 5V supply. Used to verify A/D operation.
SafetyPres	Safety Pressure Transducer
PrimaryPres	Primary Pressure Transducer
P.75V	Reference voltage for A/D calibration. 0mmHg pressure for Primary Transducer.
P4.25V	Reference voltage for A/D calibration. 300mmHg pressure for Primary Transducer.
Print-Temp	Printhead Temperature, used to compensate printer strobe width.

Model 622/623: Vbatt Battery Voltage, used to warn of low battery condition
Model 621: Not Used.
Model 622/623 BattCurrent: Battery charger current, used in service mode verification.

Model 621	LithMeas Backup Battery voltage (Lithium Battery) Used to warn user of low backup battery condition.

NIBP Circuits

Overview - Safety:

Two pressure transducers are used, a primary and safety transducer. The primary is used to make all BP measurements. Hardware circuits monitor the output of the primary transducer, looking for overpressure faults. In addition, Software monitors the digitized outputs of the primary transducer, and detects overpressure faults. The following overpressure faults are detected in software (monitored once per second):

>=10mmHg pressure for 295 seconds
>=15mmHg pressure for 175 seconds
>295mmHg pressure for 0.5 seconds.

Software detected overpressure faults are considered application faults. The user is warned of a fault with an audible alarm and a 'Check blood pressure cuff' message on the CRT display. NIBP is not disabled for this type of fault. In the event of a fault, the drive signals to the NIBP pump and valve are opened.

Two hardware faults are detected, pressure over 330mmHg (nominal trip point 314mmHg, and pressure over 15mmHg for three minutes (13.3mmHg nominal trip point). These faults are considered more serious (since software should have detected and corrected this condition). The user is notified with a 'BP SYSTEM FAULT' message, and NIBP is disabled. A redundant safety transistor is opened to ensure the NIBP pump is off and the valve is open.

The primary and safety transducer outputs are continuously digitized. The outputs of the transducers are checked vs. each other, and if they disagree, an 'NIBP Fault Message' is declared and the NIBP system is disabled. The outputs of the transducers are linearly proportional to the supply voltage (supply current for the safety transducer). The transducers use unique reference voltages to ensure that a fault in one reference will not cause an equivalent gain error in both transducers.

The A/D also has redundant checks. Two reference voltages (derived from the primary transducer reference supply) are measured, and the A/D gain and zero is checked. In addition, a unique reference is digitized, and compared vs. expected results. An error in any of these A/D measurements will again cause an 'NIBP Fault Message', and the NIBP system will be disabled.

Primary Transducer - Amplifier:

The primary pressure transducer is a fully calibrated and compensated transducer with built in voltage amplification. The output of the transducer is proportional to the supply voltage. With a 5V supply, the output of the transducer is:
0mmHg = 0.5V.
300mmHg = 4V.
Op amp U204A is used to level shift the output of the transducer such that the nominal voltage for 0mmHg is set to 0.75V. The CPU monitors the digitized zero pressure voltage, and any offset is corrected. This correction comes from the summation of an error correction signal through op amp U204B. The CPU will output a pulse width modulated signal at 76.8KHz. This signal is RC filtered to provide ad DC voltage at U204-5. This signal can adjust the offset seen at the A/D converter by +/-20mmHg.

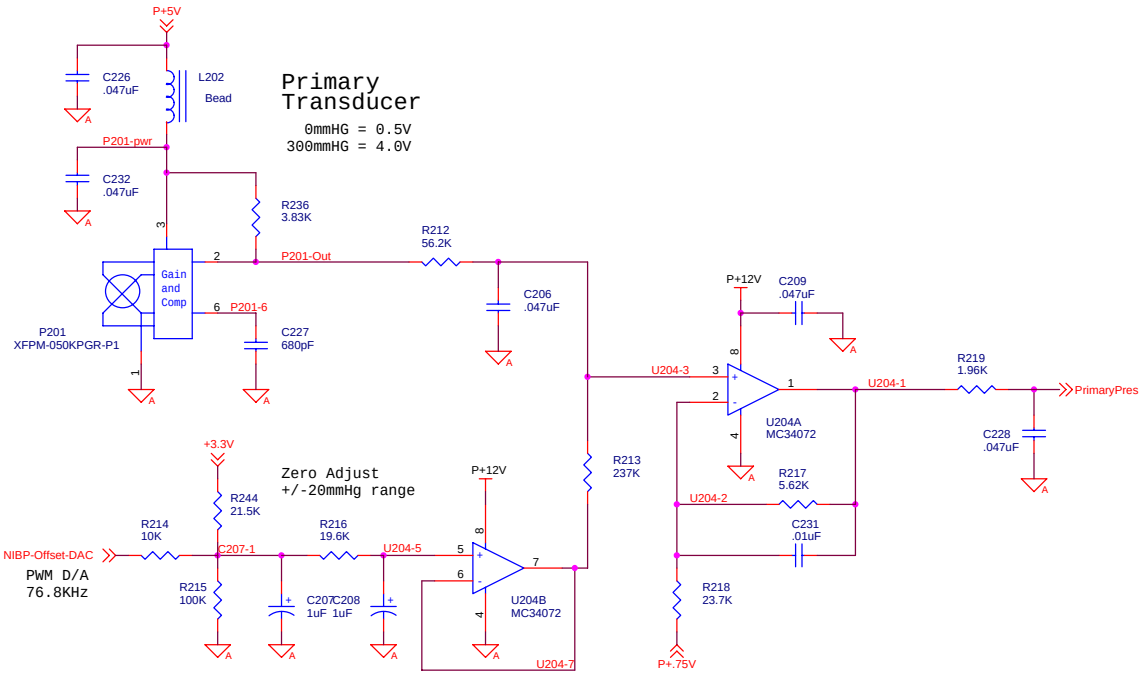

Figure A-12. Primary transducer amplifier.

Safety Transducer - Amplifier

The safety transducer is compensated for temperature drift, but gain and zero are not calibrated. The safety transducer does not include built in voltage amplification. The safety transducer output is a differential voltage, proportional to the supply current through the device.

The initial accuracy of the safety transducer is very loose, in the order of +/-50%. However, the drift over time and temperature is very good. Then, it is necessary to calibrate the output of the safety transducer. This is done my measuring a know pressure, measuring the output of the safety transducer, and storing calibration constants in NVRAM. A two-point calibration procedure is used. Calibration is done at the factory, and can be recalibrated in the field if necessary.

Current Source:

Op amp U205A is configured as a current source for the Pressure Transducer, with the current through the transducer set to 1.5mA. Nominal gain for the transducer is 300mmHg = 75mV.

Differential Amplifier and Offset Centering:

The output of the safety transducer is a differential voltage, with a nominal gain of 0.25mV/mmHg, and a zero pressure offset voltage of +/-25mV. The A/D converter has an input voltage range of 0.5V to 5V. It is necessary to both add both signal gain and offset centering to the transducer output before digitalization.

Op amp U206A/B is configured as a differential amplifier, with a voltage gain of 22.5. The output of the differential amplifier is offset by 1.2V (U205B).

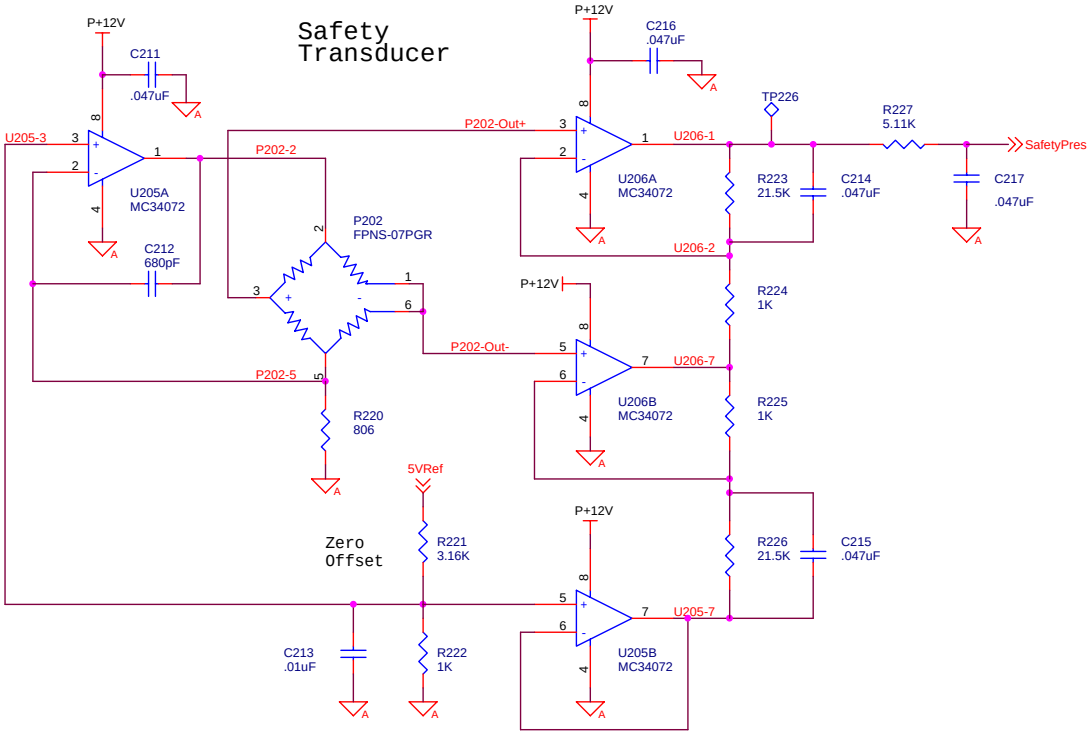

Figure A-13. Safety transducer amplifier.

Hardware Overpressure:

The output of the primary transducer is monitored for two overpressure conditions; pressures in excess of 13.3mmHg (nominal) and 314mmHg (nominal) are detected. These error conditions are transmitted to the gate array on the CPU board, and if the error conditions are present for a long enough time period, a fault message is displayed, and NIBP is disabled (see above for safety performance operation).

The output of the Primary Transducer drives the two comparators U203A/B. The comparison voltage is derived through a resistor divider chain from a 5V regulator (U201). This regulator is the supply voltage for the primary transducer, and sense the primary output is proportional to the supply voltage, tolerance errors in the regulator are not critical.

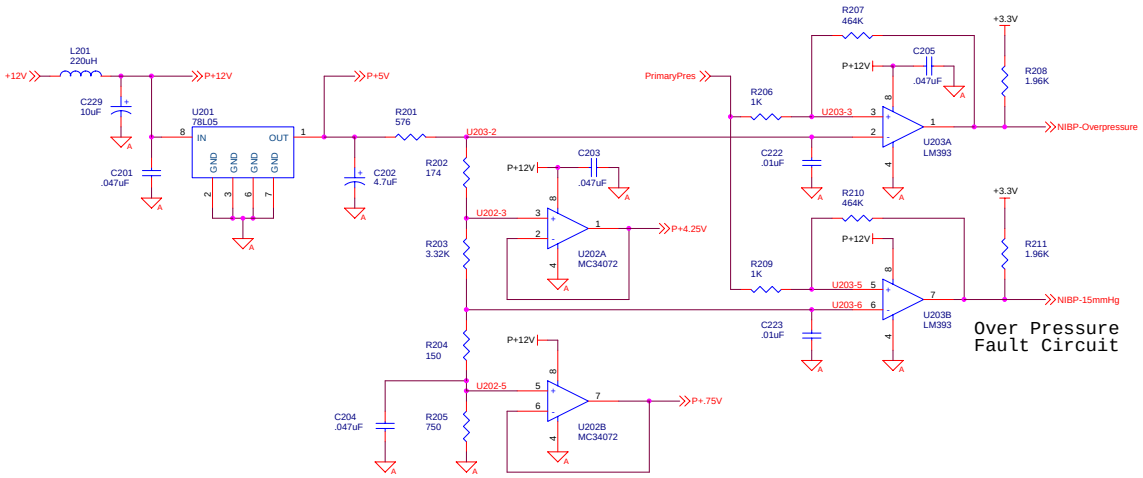

Figure A-14. Over pressure fault circuit.

Pump and Relay Drive:

Two independent dual transistor switches, Q202 and Q203 control the pump and valve. Q202 is controlled by logic circuits on the CPU board, and is normally in the on state. Q202 is only opened in a fault condition (over pressure, A/D calibration error, or transducer mismatch). Once a fault is detected, Q202 will remain open until power is cycled. Under normal operation, dual transistor Q203 is used to switch the pump on and close the valve. The pump-on and valve-close commands are controlled by software. Note that the valve is normally open. Then, in the case of no power, the valve will be in the open state.

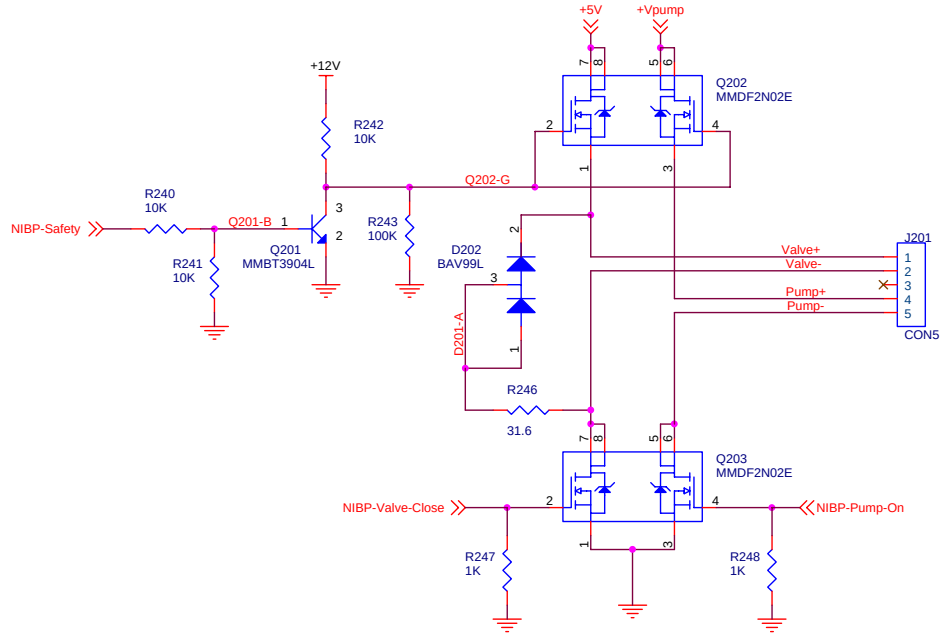

Figure A-15. Pump relay circuit.

Note: *Model 621 uses a single Mosfet for transistor Q202, with the drain connected to +6V, and the source connected to nets 'Pump+' and 'Valve+' through a series diode.*

CRT Deflection Board

Overview:

Atlas uses a 5-inch monochrome CRT display. This CRT will display Waveform Data (ECG and Respiration or SpO2 or $ETCO_2$), plus Text Data (Heart Rate, Alarm Values, Trend Data, setup, and service menus). The CRT Deflection board performs the following functions:
1. Vertical Deflection.
2. Horizontal Deflection.
3. CRT Grid Voltages.
4. Video Amplifier.

CRT Deflection is magnetic, vertical and horizontal deflection is controlled by regulating current through the vertical and horizontal coils of the CRT Yoke. The Deflection board is designed to the following specifications:

Resolution: VGA (640X480)
Dot Clock: 39.7nSec (1/25.175Mhz)
Display Size: 100mm (Horizontal) X 68mm (Vertical)

Vertical: Scan Rate: 60Hz
Reset Time: 750uSec
Blanking Time:1.2mSec

Horizontal: Scan Rate: 31.5Khz
Reset Time: 5uSec
Blanking Time: 5.7uSec

Vertical Amplifier:

Ramp Generator:

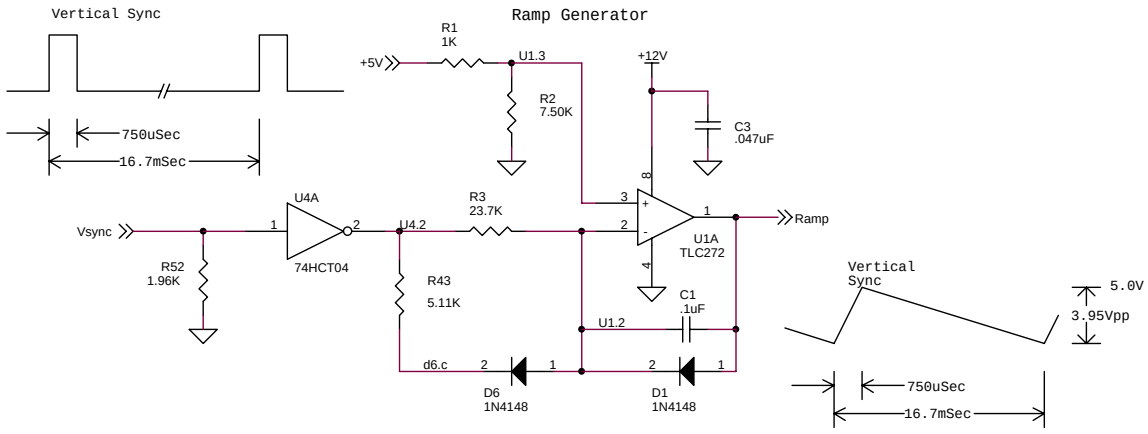

Figure A-16. Ramp generator circuit.

A ramp generator is built from the integrator (U1A, C1, and R3). The slope of the integrator

is: V = (I*T)/C. The integrator is designed so that it ramps up 6.97V in 750uS and ramps down 3.95V in 15.9mS. Diode D1 clips the output voltage at about 5.0V (U1-pin3 + Vdiode). Then the ramp resets at 5.0V each cycle, and integrates down 3.95V.

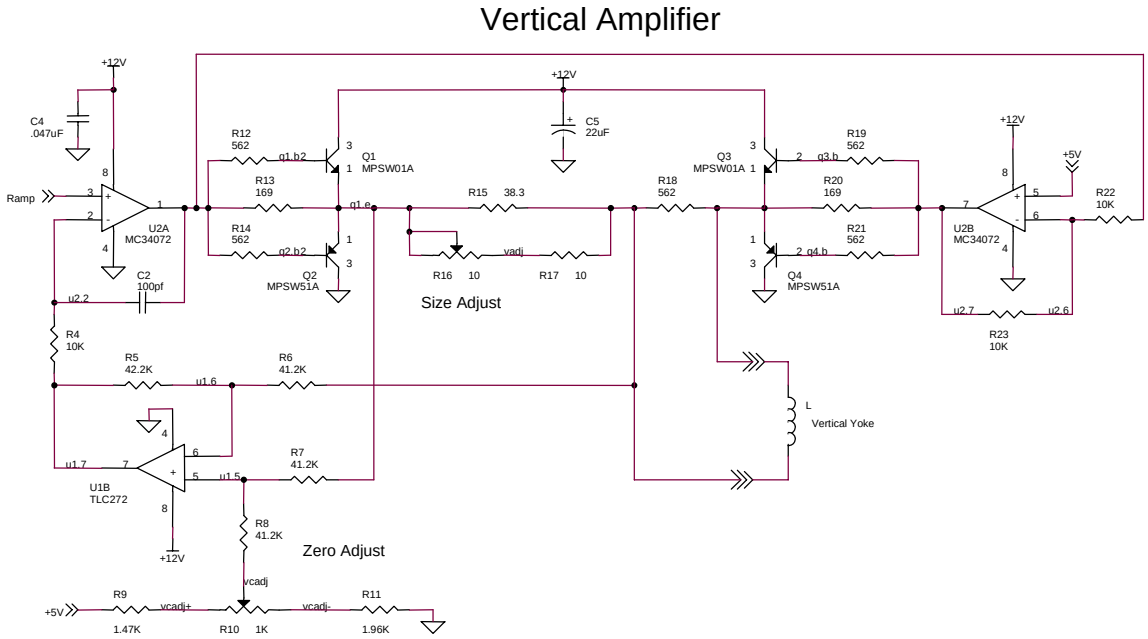

Figure A-17. Vertical amplifier circuit

Vertical Amplifier:

The Vertical amplifier will generate a linear current ramp of +/-200mA. The vertical amplifier is an H-Bridge type driver. Positive current flow (deflecting the beam above the centerline) is defined as current from +12V to Q1 to Rsense through the coil to Q4 to Ground. The negative current path is from +12V to Q3 through the Coil to Rsense to Q2 to Ground.

The input to the vertical amplifier is the ramp voltage generated above. The objective of the vertical amp is to match the current through the vertical coil with the input ramp control voltage. Current through the vertical coil is monitored through the sense resistor, formed from R15, R16, and R17. Voltage across the sense resistor is measured with the differential amplifier U1B. This voltage is then used as the feedback voltage to the control opamp, U2A.

Zero Adjust:

The output voltage from the ramp generator is a ramp from 5.0V to 1.05V (nominal). The center of this ramp is 3.0V. Then, the output of the current sense diff amp must be offset by 3.0V. This is accomplished with the Zero Adjust Network, Resistors R9, R10, and R11. Vertical centering is then accomplished by writing a pattern to the CRT, and adjusting R10 to center the display.

Size Adjust:

Adjusting the current through the Vertical Coil changes vertical deflection. The voltage across the sense resistor is:
Vsense = (Vramp-Voffset) / 1.02 (1.02 is the gain of the current sense diff amp)
Current through the coil is equal to current through the sense resistor network.
coil = Isense = Vsense / Rsense
Then, adjusting the value of the sense resistor will change the current through the vertical coil. Vertical gain is then accomplished by writing a pattern to the CRT, and adjusting R16 to set vertical deflection.

Horizontal Amplifier:

Current through the transformer increases linearly as Transistor Q6 is On (I = VdT/L). When the transistor opens, the drain voltage kicks up, and the current through the Transformer coil flows through C9, L2, L3, and the Horizontal Coil to Ground The transformer quickly loses flux (reset time < 5uSec). Current continues to flow in load inductance, from Ground through Q6-diode, C9, L2, L3, and the Horizontal Coil to Ground. This current flow charges capacitor C9. The current decreases linearly to 0, then changes directions. This is due to the AC coupling capacitor C9 being charged to a negative voltage. Current flow is then from Ground through the Horizontal Coil, L2, L3, C9, and Q6 to Ground.

The drive to MOSFET Q6 is AC coupled. This will prevent Q6 to be driven high in the event of a faulty driver on the CPU board.

In order to get adequate deflection current (about +/-2.3Amps), 18.5V across the transformer coil is necessary. A “boost” winding is added to the transformer, then when the voltage on the transistor drain flys up, current flows into capacitor C11. C11 charges to a voltage determined by the turns ratio in the transformer.

Horizontal Gain:

Horizontal deflection is adjusted by changing the current through the Horizontal coil. Changing the series inductance in the Horizontal Deflection Path modifies the current. Increasing Horizontal gain is then accomplished by writing a pattern to the CRT, and adjusting the “width coil”, L3.

Horizontal Centering:

Horizontal centering is accomplished by rotating magnets mounted on the CRT Yoke assembly.

Grid Voltages:

The following voltages are developed to bias the grids on the CRT:
Grid 1: 10V to -50V DC (Brightness Adjust)
Grid 2: 350VDC
Grid 4: 0V to 350VDC (Focus Adjust)
Anode: 7.5KV

These voltages are derived from additional windings on the FBT. In addition, the supply voltage for the video amplifier (+36VDC) is generated from a tap on the FBT.

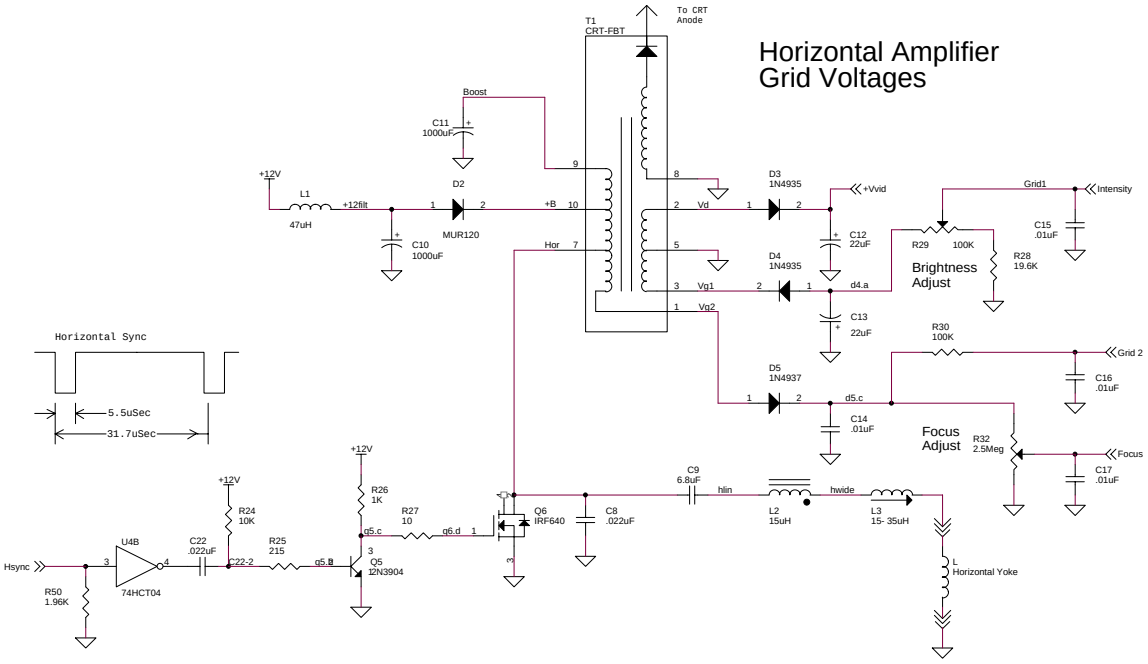

Figure A-18. Horizontal amplifier grid voltage circuit.

Video Amplifier:

The CRT tube turns a dot on when video out is low (near 0V), and off when video out is high (+Vvid = 28V). The input to the video amplifier is a digital signal (3.3V logic level) from the uProcessor. An input of 0V turns the dot off, an input of 3.3V turns the dot on. Transistor Q7 amplifies and inverts this signal. Video out is driven low through D7, and driven high through emitter follower Q8. .

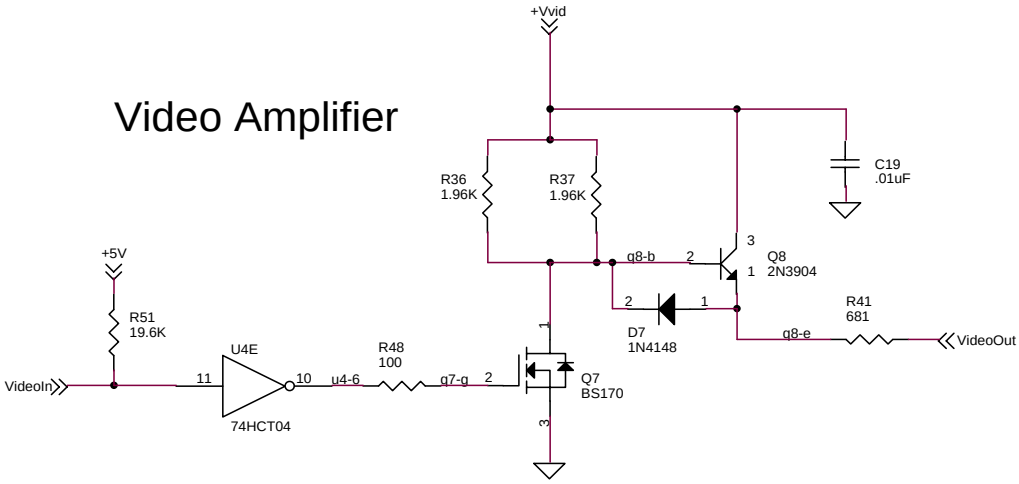

Figure A-19. Video amplifier circuit.

Recorder Electronics

Overview:

Atlas includes a thermal strip chart printer (optional on Model 200 and 210, standard on model 220). The user can print either annotated waveform data or Patient trend information.

The printer specifications are:

Paper Size: 56 or 58mm (2 1/4 inches)
Printhead Width: 54mm (2 1/8 inches)
Resolution: Vertical: 8 dots/mm, (200 dots/inch)
Horizontal: 12 dots/mm (300 dots/inch)
Chart Speed: 25mm/sec (1 inch/second)

The main CPU controls the printer. Data timing, clock signals, and strobe widths are all generated by the FPGA on the CPU board. These signals are buffered on the recorder board (inverter U5), before transmission to the printhead.

Power Supply – 24 Switcher

It is necessary to generate 24VDC for the print head and motor. The input to the 24V switcher is either 12V from the AC/DC converter, or Battery voltage on the model 210/220 when AC is not present. The circuit is configured as a boost PWM using current mode feedback. The PWM controller is a UC3843A. The controller includes an internal 2.5V, 1% reference, and an external 5V, 1% reference. Nominal output voltage for the boost converter is Vout = [2.5V*(1 + 84.5K/10K)] = 23.6V.

The converter will run at duty cycles over 50%, which requires slope compensation for a current mode controller. Slope compensation is added by summing in part of the oscillator signal with the current sense line.

The PWM current limits on a cycle to cycle basis. The supply will be in current limit when the Isense line reaches 1V. Current limit is set to about 3.5 Amps from 12VDC or 5Amps from battery.

Two control signals exist for the 24V switcher, n24Von and Rec-Supply-On. The 24V switcher is disabled when n24Von is high. This signal is controlled by the on board PIC processor. The switcher is held off at power up, and allowed to start after 50mSec. This is done to reduce inrush current at power up. The signal Rec-Supply-On enables power to the print head, and is controlled by the main CPU. Power is only applied to the print head when the recorder is running.

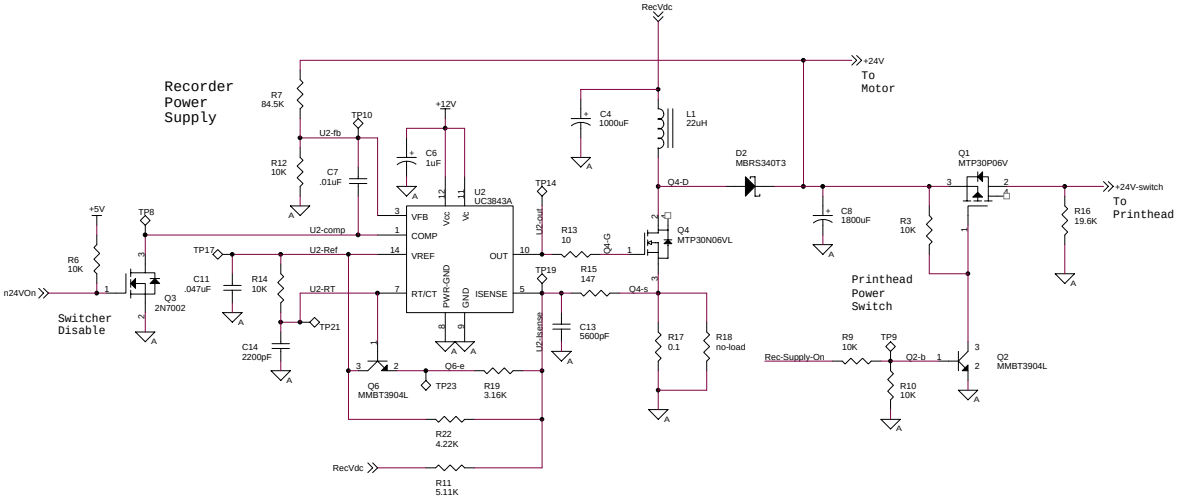

Figure A-20. Recorder power supply circuit.

Motor Driver:

Atlas uses a stepper motor to drive the paper. The microcontroller (U3) is programmed to apply the appropriate phased signal to the motor. A quad darlington switch (U6) amplifies the signal from the controller to signal levels needed to drive the motor. Motor speed timing is derived from the main CPU, and transmitted to U3 on signal line U3-clk (U2-pin2).

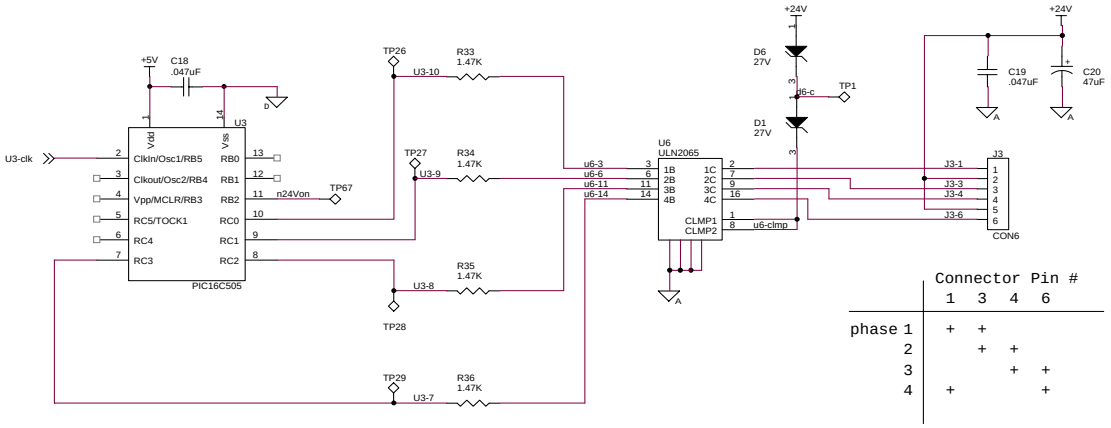

Figure A-21. Printer motor drive circuit.

Temperature Amplifier:

The printer will print darker as temperature is increased. Print darkness can adjusted by controlling the time a dot is turned on. A thermistor is included on the printhead. This thermistor is nominally 30K, and decreases as temperature increases. The output of the temperature amplifier is a function of the thermistor voltage, Temp = .755*(1+R8/Rtherm). This voltage is digitized (on the main board), and the CPU can compensate dot width in order to maintain consistent printing over temperature.

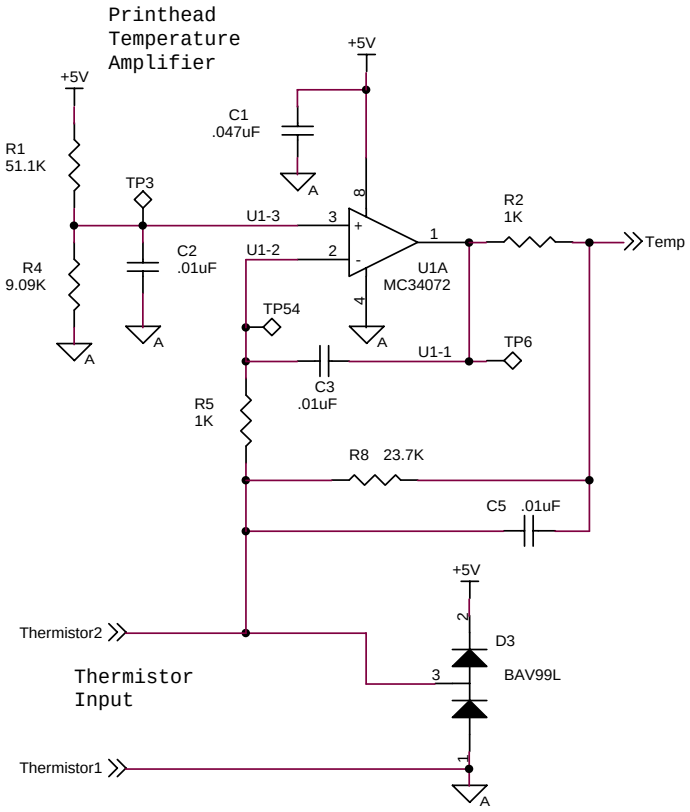

Figure A-22. Print head temperature circuit.

Patient Isolated Circuits

Isolated Power

Isolated power is provided to the ECG, SpO2, Temperature, and Impedance Respiration circuits using an Isolation Transformer T401 (temperature and respiration on models 622 and 623 only). The power supply is a PWM controlled flyback converter. The PWM controller is an LM3524. Output voltage f+V is sampled and compared with a 5V reference voltage. An error voltage is generated, and this voltage returned via opto U410. Voltage f+V is regulated to 7.4V. A second tap on transformer T401 provides f-V (-7.4V). The switcher operates at 76.8KHz, controlled by a sync signal from the CPU board. The power supply is synchronized with the A/D converter used to digitize ECG, Temperature and Respiration signals.

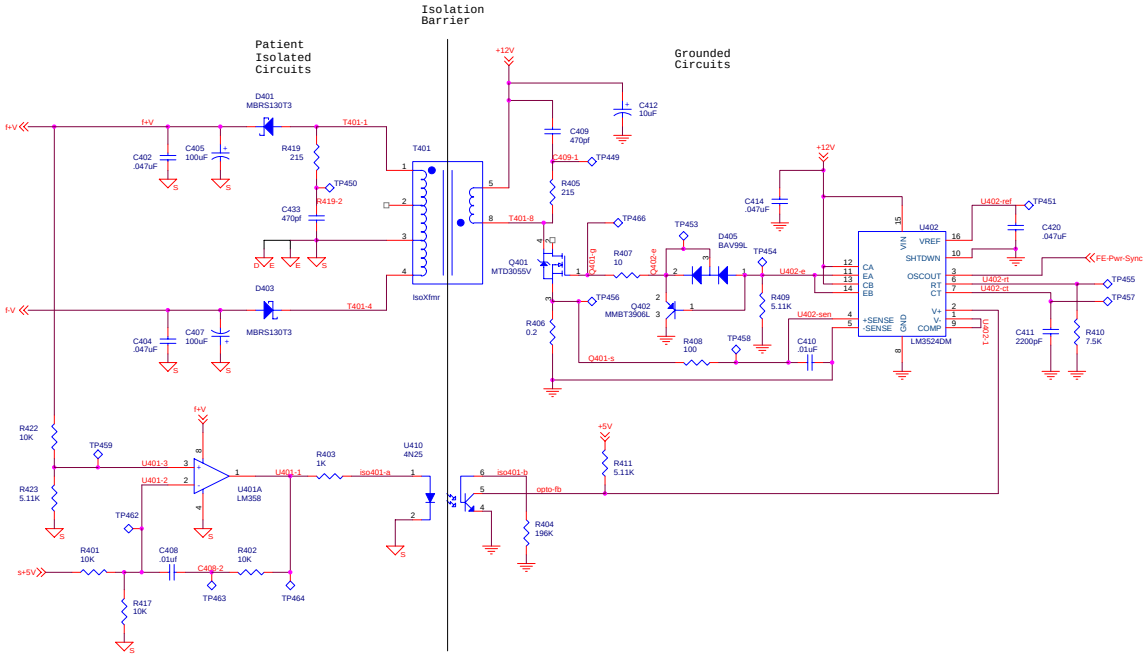

Figure A-23. Patient isolation circuit.

Linear Regulators and Filtering – Model 621

From the raw f+V and f-V voltages (labeled fVcc and fVee on model 621), the following supplies are generated for the various patient isolated circuits:
iso+5dig: Regulated 5V supply. This voltage is used to power the opto-isolators and digital control logic. This is also the reference voltage used in the regulation of f+V.
f+5V: Regulated +5V supply: Filtered and buffered from iso+5dig, this voltage is used for the A/D reference.
fVcc: This voltage is used to power the Op-Amps used in the ECG and A/D circuits. This voltage also powers the Nonin SpO2 electronics.
fVee: This voltage is used to power the Op-Amps used in the ECG and A/D circuits.

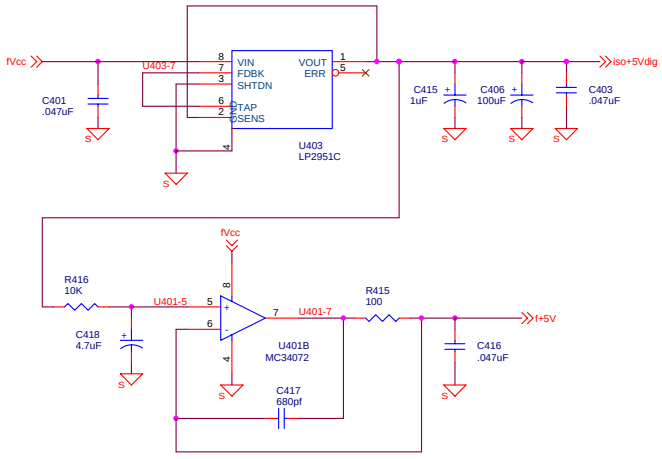

Figure A-24. Model 621 line regulation and filtering.

Linear Regulators and Filtering – Model 622 and 623

From the raw f+V and f-V voltages, the following supplies are generated for the various patient isolated circuits:
iso+5dig: Regulated 5V supply. This voltage is used to power the opto-isolators, digital control logic, and 5V digital supply for the Nellcor SpO2 board.
s+5V: Regulated +5V supply: Analog 5V supply for the Nellcor SpO2 board. This is also the reference voltage used in the regulation of f+V.
f+5V: Regulated +5V supply: Filtered and buffered from s+5V, this voltage is used for the A/D reference.
s-5V: Regulated –5V supply: Analog –5V supply used for the Nellcor SpO2 board.
fVcc: LC Filtered voltage, derived from f+V. This voltage is used to power the Op-Amps used in the ECG, Respiration, Temperature, and A/D circuits.
fVee: LC Filtered voltage, derived from f-V. This voltage is used to power the Op-Amps used in the ECG, Respiration, Temperature, and A/D circuits.

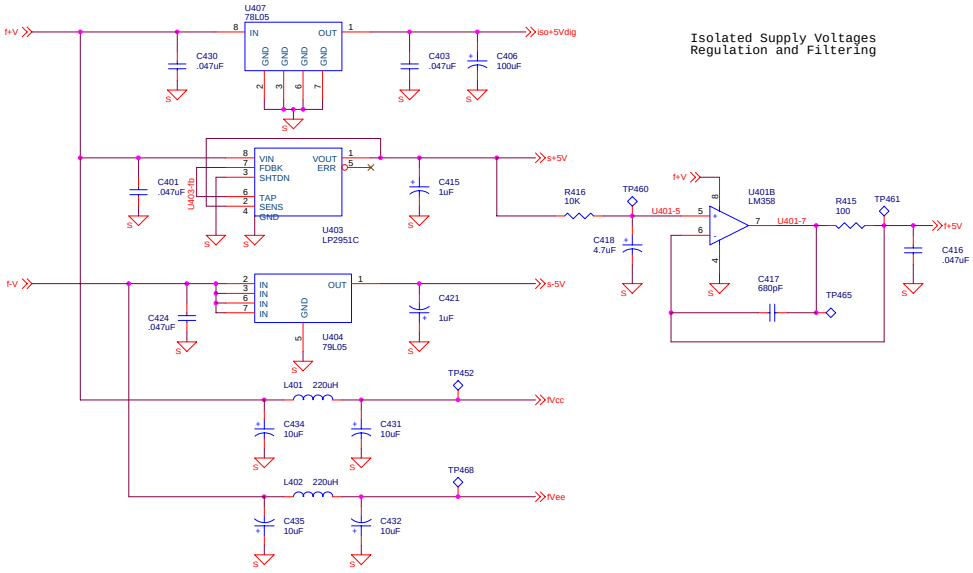

Figure A-25. Model 622/623 line regulation and filtering.

A/D Circuits

M A/D

A pulse width modulator is used as an A/D converter. The PWM runs at a 1.2KHz rate, synchronized by the A/D sync signal. A/D sync is low for 52.1uSec, high for 781.25uSec. Using the values shown, the integrator will ramp down 10.01V, and ramp up 25V. The voltage at the integrator output (U601-1) is limited to about 5V [5V*(73.2/83.2) + Vdiode)]. Then, the integrator starts at 5V and ramps linearly down to –5V.

The analog input voltage to be digitized and the integrator output are the inputs to a comparator. The output of the comparator is low at the start of an A/D cycle, and switches high as the integrator ramp drops below the input voltage being digitized (see the timing diagram below). A/D conversion is accomplished by measuring the width of the PWM output signal. The A/D timer runs at 25.175MHz, then the A/D resolution is about 21000 counts (over 14 bits). Hysteresis is added to the comparator to avoid oscillations during switching. Note that since the output of the comparator is low at the start of the A/D cycle, a resistor divider is formed at the comparator input. This divider reduces the Analog-In signal by 0.75% [464K/(464K+3.48K)].

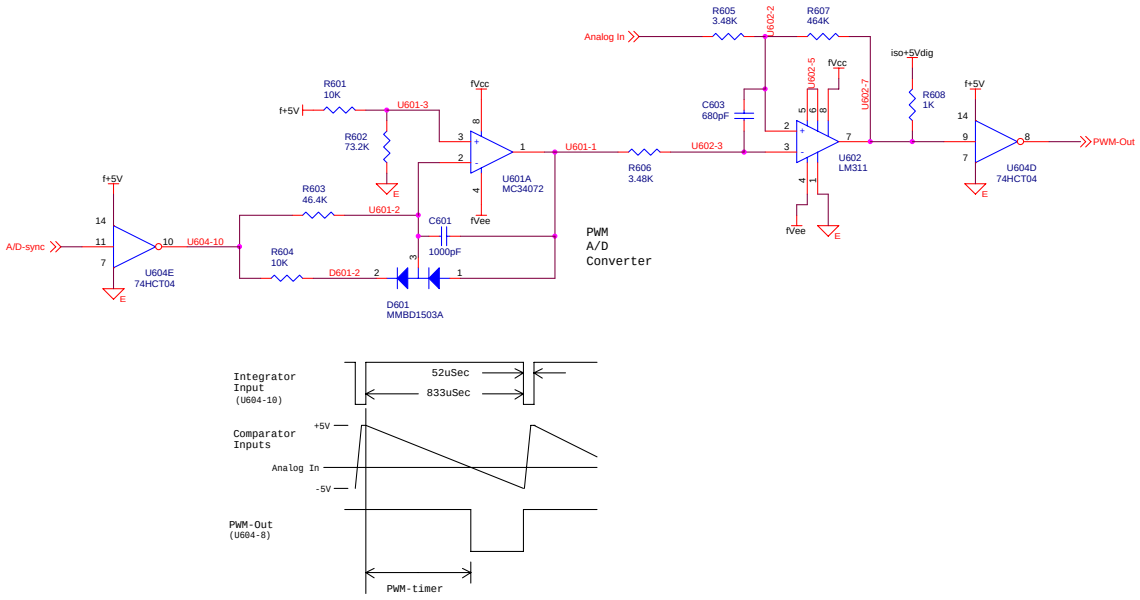

Figure A-26. A/D converter circuit.

A/D Multiplexer

The model 621 uses an 8-channel multiplexer, the model 622/623 uses a 16-channel multiplexer, to select the analog signal to be digitized. Control of the multiplexer is through a serial communication channel from the main CPU. The following signals are digitized:

Ground	Ground Reference for digitized signals, used in calibrating the A/D converter
ECG	Amplified ECG signal
V Buffer	Output of the V-lead buffer, used to determine leads off
LL Buffer	Output of the LL-lead buffer, used to determine leads off
LA Buffer	Output of the LA-lead buffer, used to determine leads off
RA Buffer	Output of the RA-lead buffer, used to determine leads off
f1.24V	Reference Voltage, used in calibrating the A/D converter
RL Output	Output of the RL amplifier
Patient Temp	Analog voltage representing patient Temperature (model 622/623 only)
Respiration	Amplified Respiration signal (model 622/623 only)
Resp Leads Off	DC impedance for respiration, used to determine respiration Leads off (model 622/623 only).

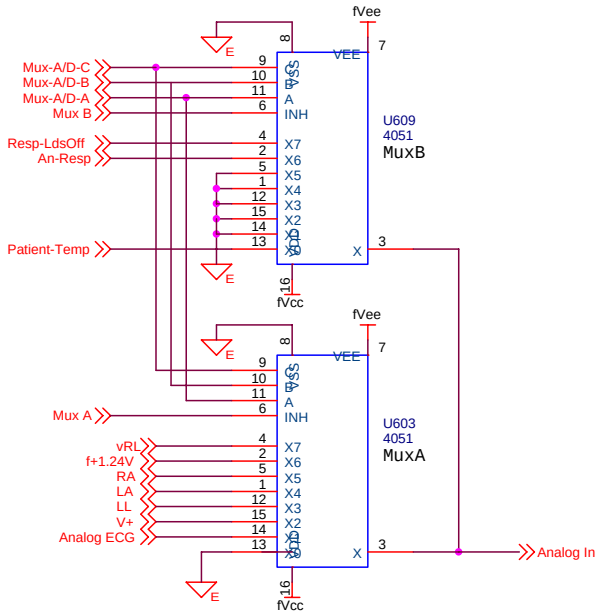

Figure A-27. A/D multiplexer circuit.

Note: *U609 not used in model 621.*

Serial Communication

Serial data is transmitted to the isolated circuits through Optical Isolators. The following signals are transmitted from the CPU board to the isolated circuits:

1. FE-Serial-Data: Serial Data transmitted from the CPU board to the Isolated circuits.
2. FE-Data-Clk: Serial Data Clock.
3. A/D Clk: Serial Data latch. Also used as clock for PMW A/D converter.

Serial Data is converted to a parallel format using Shift Register U605 and U606. The following Data is transmitted from the CPU board to the isolated circuits:

1.	Mux-A/D-A	Control bit A for A/D Mux
2.	Mux-A/D-B	Control bit B for A/D Mux
3.	Mux-A/D-C	Control bit C for A/D Mux
4.	Mux-Lds-A	Control bit A for ECG Lead Select Mux
5.	Mux-Lds-B	Control bit B for ECG Lead Select Mux
6.	Mux-Lds-C	Control bit C for ECG Lead Select Mux
7.	Sw-RLD-RA	Switch Reference Electrode to RA
8.	Sw-RLD-LA	Switch Reference Electrode to LA
9.	Sw-RLD-LL	Switch Reference Electrode to LL
10.	Sw-RLD-RL	Switch Reference Electrode to RL
11.	MonBW	Select 0.5Hz ECG high pass pole (used to restore ECG baseline).
12.	MuxB	0 – Select A/D Mux B; 1 - Select A/D Mux A
13.	Sw-RLD-V	Switch Reference Electrode to V
14.	Sw-RespReset	Switch Respiration High Pass Pole, used to restore baseline (model 622/623)
15.	SpO2Reset	Reset Nellcor SpO2 board (model 622/623 only)
16.	Resp-Off	Turn respiration off when respiration not used (shuts down drive signal) (model 622/623 only).

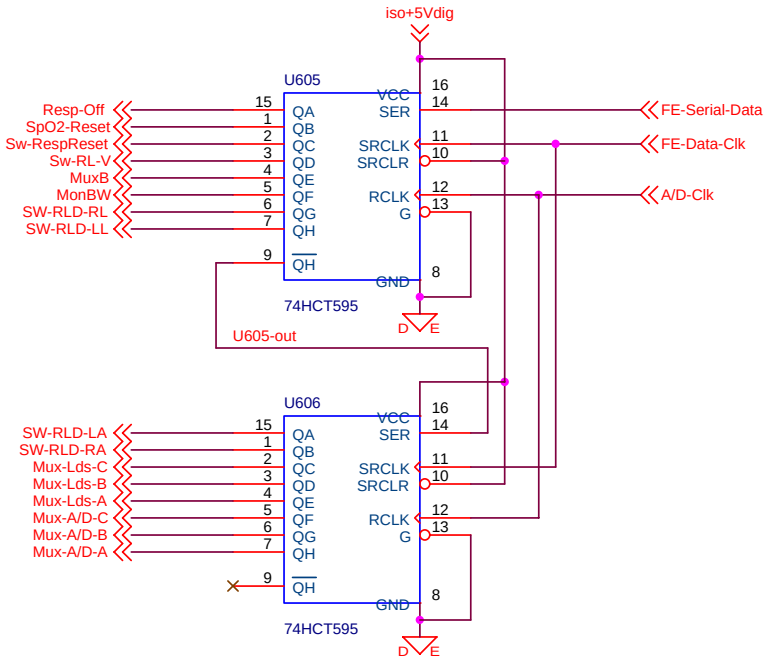

Figure A-28. Serial communication circuit.

Signal Isolation

Optocouplers are used to electrically isolate signals. The following signals are transmitted across the isolation barrier through the optocouplers:

1. SpO2 out: SpO2 serial data, waveform and status information.
   Opto U411 Data from the SpO2 board to the CPU board.
2. Serial Data: Serial Control data for isolated circuits.
   Opto U613 Data from the CPU board to isolated circuits.
3. Serial Data Clock:Data clock for serial control data.
   Opto U612 Clock from the CPU board to isolated circuits.
4. ADC Clock Clock for PWM A/D converter, also used to latch control shift registers.
   Opto U611 Clock from the CPU board to isolated circuits.
5. PWM A/D dataA/D Pulse width data.
   Opto U610 Pulse width data from isolated circuits to CPU board.
6. Respiration ClockClock for Respiration drive circuit (same signal as power supply sync)
   U710 Clock from the CPU board to isolated circuits (model 622/623 only).

ECG Circuits

Overview

Atlas provides a 5-wire front end, and will be compatible with both a 3-wire and 5-wire cable. Monitor (0.5Hz to 40Hz) Extended (0.05Hz to 100Hz) bandwidth are provided. The ECG amplifier always transmits 0.05Hz to 100Hz data to the CPU board (unless in baseline restore mode), additional filtering for Monitor Bandwidth is implemented in software.

Defib Protect, RFI Filtering

The ECG lead set includes a 1K resistor for current limiting. The neon bulbs act as a voltage clamp, limiting voltage to about 100V. Neons are chosen for their low capacitance and high DC impedance when off. Series resistors and diode clamps are used as a second set of protection circuits for the front-end amplifiers. Resistors R506, R507 and Diodes D506, D507, are used to reverse bias the lead clamp diodes (D501 to D505). Two passive RC filters are used to reduce susceptibility to RFI and ESU.

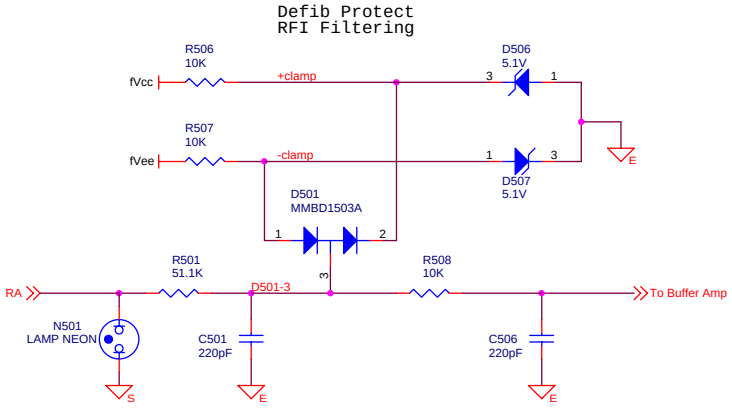

Figure A-29. Defib protect and RFI filtering circuit.

Note: *Typical protection for each lead wire. Model 621 uses a dual silicon series diode in place of zener diodes D506 and D507.*

Front End Buffer - 1st Gain Stage

Gain of the first stage is 9.26 (1+10K/1.21K). Bias current for each input buffer is set to 1.25V/44Meg = 28nA (VldsOff = 1.25V). On a leads-off condition, the two 22Meg resistor drives the input of the buffer to 1.25V (VldsOff), and the amplifier output saturates high (at about 5.5V). The voltage out of each buffer is monitored to detect a leads-off condition.

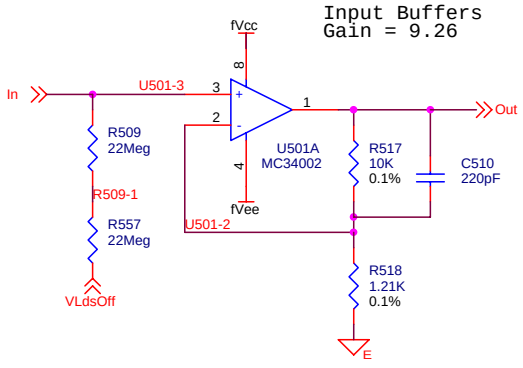

Figure A-30. Input buffer circuit.

Wilson Network - Lead Select Mux

A 5 wire front end must be able to render the following vectors:

I	LA - RA
II	LL - RA
III	LL - LA
aVR	RA - 1/2*(LA + LL)
aVL	LA - 1/2*(RA + LL)
aVF	LL - 1/2*(LA + RA)
V	V - 1/3*(RA + LA + LL)

A resistor divider network (Wilson Network) is used to create the terms above. These vectors are then switched though the two Lead Select Mux's and into the differential amplifier.

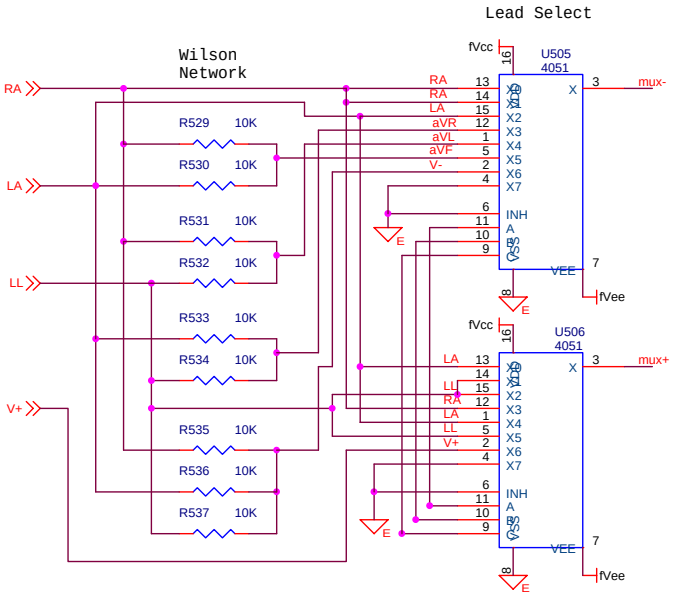

Figure A-31. Lead select circuit.

Differential Amplifier and Slew rate limit

A traditional 3-opamp gain stage (U507 and U508) is used to construct the differential amplifier. The topology is modified slightly with the addition of slew rate limiting (U509). The ECG signal is slew rate limited to about 100V/sec. This is done to minimize distortion of the ECG trace in the presence or large pace pulses. The differential outputs of this amplifier stage are used as input to the Right Leg Drive amplifier.

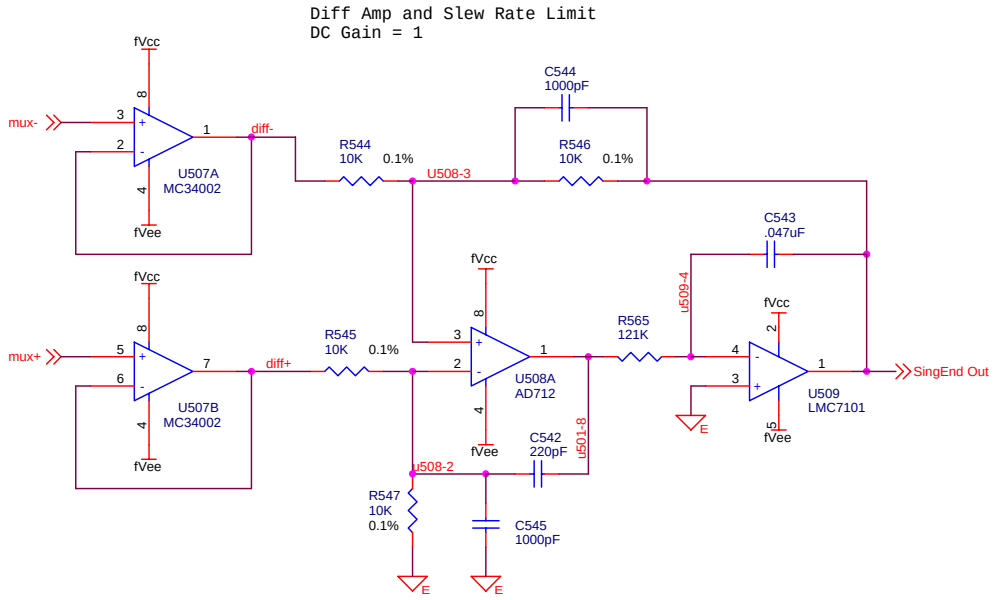

Figure A-32. Differential amp/slew rate amp circuit.

Right Leg Drive Amplifier

The right leg amplifier performs two functions. First is to provide bias current to the input buffer amplifiers. Second, to reduce 60Hz interference (increase CMR). Patient Common mode signals are amplified and inverted, and this resultant signal used to drive the patient. Gain of the RLD amplifier at 60Hz is maximized, while keeping the system gain stable. The RLD output is mux'd to the appropriate wire depending on the chosen input vector. For example, when looking at Lead I (LA-RA), the RLD signal is switched to the LL buffer.

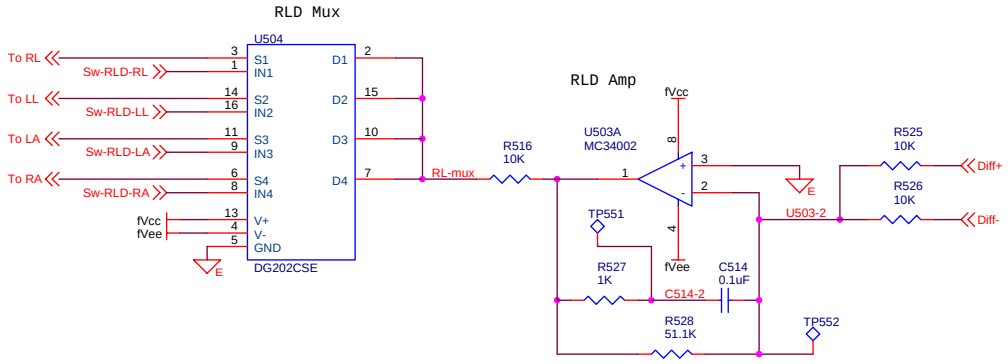

Figure A-33. Right leg drive circuit.

High Pass and Gain Stage

The signal from the output of the differential amplifier is AC coupled before a final stage of amplification. The High Pass Pole is set to 0.05Hz (a 3.3 second time constant). Large DC signals are sometimes present, for example, following a Leads Off condition. In order to quickly restore the ECG baseline, a transistor switch (Q504, Q505) is used to change the AC pole time constant to 0.33 seconds. Op Amp U508 provides the final amplification prior to the A/D converter.

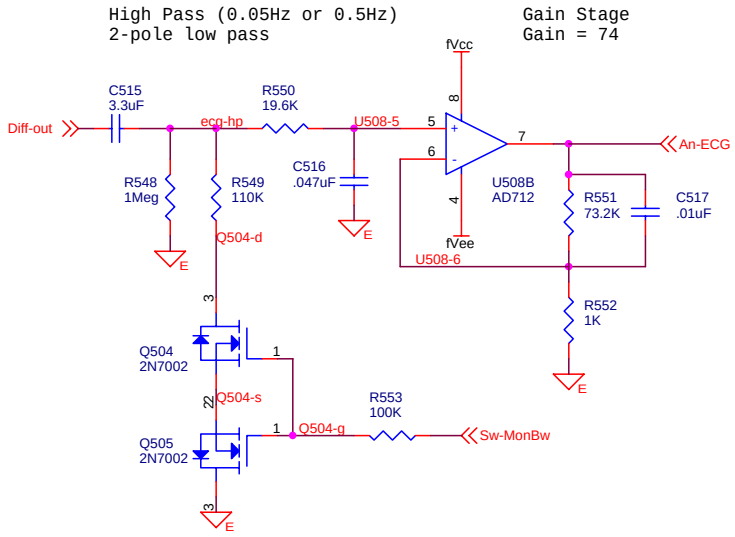

Figure A-34. High pass and gain stage circuit.

Temperature Amplifier (Model 622/623 only)

The temperature option of Atlas is designed to operate with YSI-400 series probes. This probe has a negative temperature coefficient, R@30C = 1815Ohms, R@40C = 1200Ohms. The temperature amplifier is configured as a non-inverting gain stage. The positive input to the amplifier is a 1.25V reference. The output of the temperature amplifier is V = Ref*(1+Rfb/Rthermistor).

The A/D converter will digitize the An-Temp input, along with the reference voltage and ground. The gain of the A/D is calibrated from the reference voltage measurement, and any drifts in the reference voltage or A/D gain are continuously compensated during monitoring.

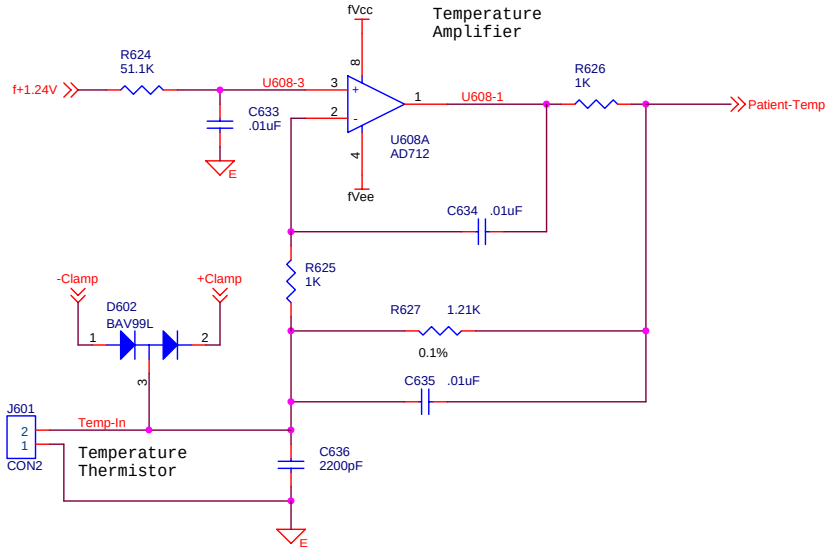

Figure A-35. Temperature amplifier circuit.

Impedance Respiration (Model 622/623 only)

Overview

Impedance respiration is accomplished by measuring a change of resistance across the patient's chest during breathing. The RA and LA electrodes (Lead I) are uses to acquire the respiration signal. A current source is driven through the patient, and the voltage developed across the patient is measured. The change in resistance caused by respiration is small, in the order of 1 Ohm. This small change must be measured on top of a large baseline impedance, typically 100 to 1000 Ohms.

Signal Source – Current Drive

An AC current source is used as the input signal, a 34.8KHz square wave. The Power supply sync signal, at 76.8KHz, is transmitted across opto isolator U710. Flip Flop U701, configured as a divide by 2, converts this signal to a 34.8KHz. Current through the patient is about 150uA Pk-Pk, set by the output of U710 (5V) and the circuit series impedance, 69K including cable resistance. The impedance of the patient is small (<2K) compared to the series impedance and has minimal affect on the magnitude of the drive current. Diode clamps are used to protect the respiration circuits in the event of a Defibrillation pulse.

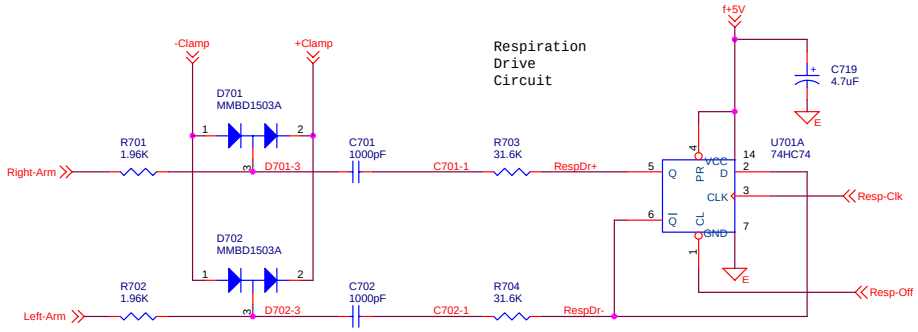

Figure A-36. Respiration drive circuit.

Differential Amplifier and Peak Detector

The AC current driven though the patient develops a voltage across the RA to LA electrodes. This signal is measured and amplified with the Differential Amplifier formed by U702A/B. This amplifier converts the differential voltage across the patient to single ended signal, with a gain of 16.8. Inverting this signal (U703A), and summing the original signal and inverted signal through the dual Diode D705 then forms a synchronous peak detector. Then, the voltage on C711 is the DC resistance seen across the RA to LA buffer. This baseline resistance is digitized, and if the signal is too large (>2.5K), a Respiration Lead Fault message is displayed. Note that this circuit measurement includes the two 1K resistors in the EKG cable set. This 2K resistance is subtracted in software before determining a leads off condition.

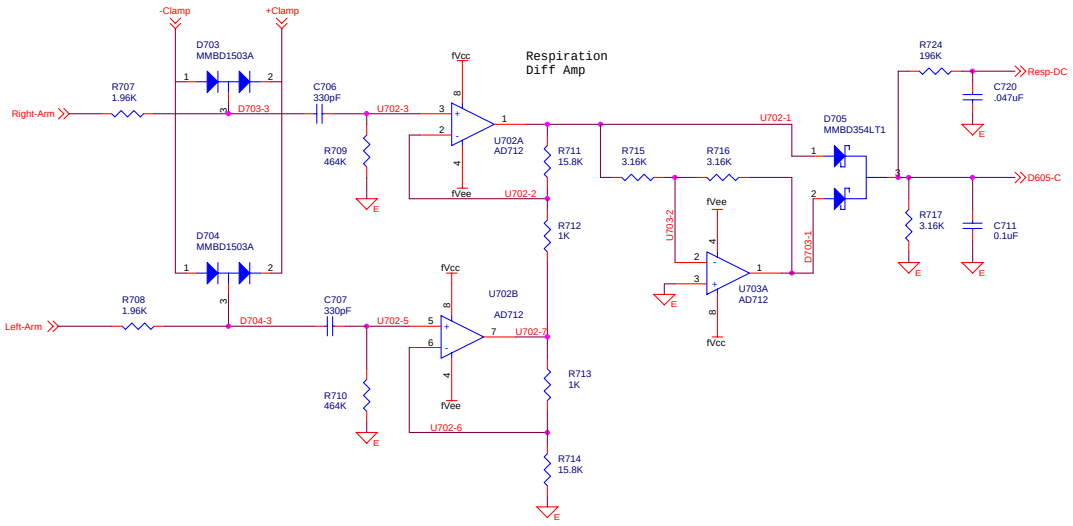

Figure A-37. Respiration diff amp circuit.

Gain and Filtering

The DC content (baseline resistance) of the respiration signal is not needed, so the signal is next AC coupled, and additional gain applied before digitization. Low pass filtering is performed at this stage to reduce high frequency noise outside the respiration signal bandwidth. A baseline-reset circuit (transistor switch Q701) is used to quickly restore the high pass pole if excessive DC voltage is present, for example following a Leads-Off condition.

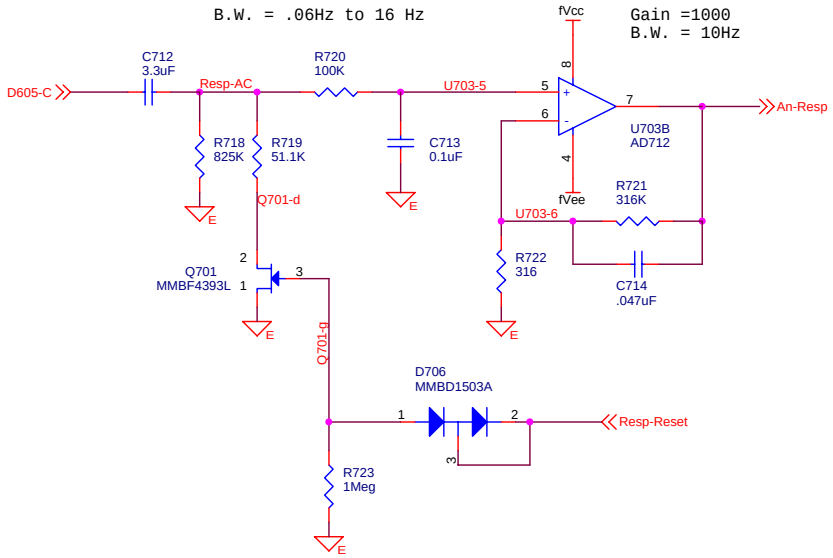

Figure A-38. Gain and filter circuit.

SpO2 Circuits

The SpO2 transducer senses oxygen content of functional arteriolar hemoglobin through the use of light (red and infrared) passed through the sensor. The reflective characteristics of hemoglobin at the wavelengths used allow the pulse oximetry circuits to obtain changing saturation levels. This data is then processed to obtain the oxygen saturation percentage and pulse rate.

Nellcor or Nonin Medical provides the SpO2 board (Nonin only for the model 621). The SpO2 board includes amplifiers and processing, and transmits serial data to the CPU board (Waveform data, SpO2%, and pulse rate). The Atlas monitor provides electrical isolation (power and data) to the SpO2 board. Note that you must use Nonin probes with the Nonin SpO2 board, and Nellcor probes with Nellcor SpO2 board.

NOTES:

1. PURCHASE FROM OKEN SEIKO CO., LTD, INAGI TOKYO, JAPAN
   PART NUMBER: P05C09.
2. DC MOTOR POWER REQUIREMENTS: RATED VOLTAGE: 6 VDC
   CURRENT: <500 mA MAX DURING PRESSURIZATION FROM 0-300 mmHg
   (STANDARD VOLUME OF 500 cc).
3. REFERENCE LEAK RATE: THE PUMP LEAK RATE WILL BE LESS THAN 15 mmHg IN 15 SECONDS WITH A 100±10 cc VOLUME PRESSURIZED TO 50 ±5 mmHg ATTACHED.
   THE PRESSURE IN THE VOLUME MUST BE STABILIZED FOR A MINIMUM OF 20 SECONDS BEFORE BEING ATTACHED TO THE PUMP. THE PUMP MUST BE RUN FOR A MINIMUM OF .75 SECONDS BEFORE BEING ATTACHED TO THE PRESSURIZED VOLUME.
4. PUMP UP SPEED: MUST PRESSURIZE STANDARD VOLUME OF 500 cc TO 5.8 PSI (300 mmHg) IN LESS THAN 10 SECONDS AT RATED POWER.

   FOR REF ONLY
   - MAXIMUM PRESSURE: 7.7 PSI (400 mmHg).
   - FLOW RATE: 2.0 LITERS / MINUTE AT NO LOAD
     1.0 LITERS/MIN AT 3.9 PSI (200 mmHg)
5. TEMPERATURE: AT 15% TO 90% RELATIVE HUMIDITY (NONCONDENSING)
   OPERATING: 0°C - +40°C, STORAGE: -20°C - +50°C

Table F-1. Changed to a new BP Valve

Model	Serial#
621N0	62201361
621SP	62100948
622N0	62201361
622NP	62201357
623SP	62300410
623NP	62300412

Table F-2. Changed E-Pac. Changed to class B power supply.

Model	Serial#
621S0	62100935
621SP	62100941
622S0	62101305
622SP	62200135
622N0	62201305
622NP	62201312
623SP	62300405
623NP	62300408

Table F-3. Upgraded printer cable to a cable with foam tape attached.

Model	Serial#
621xx	62104069
622xx	62208111
623xx	62304018

The foam tape ads extra safety into the printer cable.

Table F-4. Upgraded the Main PCB from 501 to 502.

Model	Serial#
621xx	62103000
622xx	62206000
623xx	62303000

Upgraded the Main PCB to make it ESU tolerant. Added user feature to print on alarm or not print on alarm. Software changed to 2.2

Table F-5. Upgraded the Nellcor SpO_2 PCB from 204/205 to 506.

Model	Serial#
621xx	62104000
622xx	62208000
623xx	62304000

NOTE: *The new Nellcor 506 SpO_2 PCB is backward compatibly. The new 506 SpO_2 sensor extension cable "DEC-8", that can be identified by the purple connector, is backward compatible with the older 204/205 SpO_2 PCB. The older 204/205 SpO_2 sensor extension cable "EC-8", that can be identified by the gray connector, will not work "it will not physically plug into the Atlas connector" with the new Nellcor 506 SpO_2 PCB. The software was changed to version 2.5.*

The older sensors, that are indentified by the gray connector, will not work with the newer sensor extension cables even though the sensor will physically plug into the newer sensor extension cable "DEC-8". The newer patient sensors have a purple connector and will work on the older sensor extension cables.

Atlas Calibration and Function Test Form

Atlas Model Number_____ Atlas Serial Number_____
Calibration date_____ Last Calibration date_____
Software Version_____ Boot Revision_____
SpO_2 Manufacture_____ SpO_2 PCB_____
SpO_2 Software Revision_____ CO_2 Revision_____
Last CO_2 Reset Date:_____ Last CO_2 Calibration_____

N/A=Not Applicable

Calibration Results

PASS FAIL ***Place a check mark by each of the following data items***

_____ _____ Date and time accuracy
_____ _____ BP calibration (50mmHg and 250mmHd)
_____ _____ CO_2 reset
_____ _____ CO_2 calibration
_____ _____ No load battery voltage calibration
_____ _____ Battery voltage calibration
_____ _____ Printer adjustment
_____ _____ Calibration date set
_____ _____ Software upgrade
_____ _____ Download NVRAM files

Functional test Results

_____ _____ Power on self test
_____ _____ Menu functional test
_____ _____ BP dymanic test
_____ _____ BP statc test
_____ _____ Over 15mmHg test
_____ _____ BP Dump test
_____ _____ Hardware functional test
_____ _____ ECG/Respiration test
_____ _____ SpO_2 test
_____ _____ Temperature test
_____ _____ CO_2 functional test
_____ _____ Battery functional tests
_____ _____ Printer functional test
_____ _____ Print on alarm test
_____ _____ ECG alarm test
_____ _____ Respiration alarm test
_____ _____ Silence alarm test
_____ _____ CO_2/Respiration test
_____ _____ Blood Pressure alarm test
